

SGM7SZ32

Small Logic Two-Input OR Gate

GENERAL DESCRIPTION

The SGM7SZ32 is a single two-input OR gate from SGMICRO's Small Logic series. The device is fabricated with advanced CMOS technology to achieve ultra-high speed with high output drive while maintaining low static power dissipation over a broad V_{CC} operating range. The device is specified to operate over the 1.65V to 5.5V V_{CC} operating range. The inputs and output are high impedance when V_{CC} is 0V. Inputs tolerate voltages up to 6V, independent of V_{CC} operating voltage.

The SGM7SZ32 is available in Green SOT-23-5 and SC70-5 packages. It operates over an ambient temperature range of -40°C to +85°C.

FEATURES

- **Ultra-High Speed:** $t_{PD} = 3.8\text{ns}$ (TYP) into 50pF at $V_{CC} = 3.3\text{V}$
- **High Output Drive:** $\pm 24\text{mA}$ at $V_{CC} = 3\text{V}$
- **Broad V_{CC} Operating Range:** 1.65V to 5.5V
- **Matches Performance of LCX Operated at $V_{CC} = 3.3\text{V}$**
- **Power Down High-Impedance Inputs/Output**
- **Over-Voltage Tolerance Inputs Facilitate 5V to 3V Translation**
- **Available in Green SOT-23-5 and SC70-5 Packages**

NOTE:

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

CAUTION

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

SGMICRO reserves the right to make any change in circuit design, specification or other related things if necessary without notice at any time. Please contact SGMICRO sales office to get the latest datasheet.

NOTES:

- Unused inputs must be held HIGH or LOW. They may not float.
- C_{PD} is defined as the value of the internal equivalent capacitance which is derived from dynamic operating current consumption (I_{CCD}) at no output loading and operating at 50% duty cycle (see Figure 3). C_{PD} is related to dynamic operating current I_{CCD} by the expression: I_{CCD} = (C_{PD}) (V_{CC}) (f_{IN}) + (I_{CC,Static}).

TEST CIRCUITS

C_L includes load and stray capacitance.
Input PRR = 10MHz, t_W = 500ns.
