## 600kHz, Low Noise, High Voltage, Precision Operational Amplifier

### GENERAL DESCRIPTION

The SGMOP07E is a low noise, low offset voltage and high voltage operational amplifier, which can be designed into a wide range of applications. The SGMOP07E has a high gain-bandwidth product of 600kHz, a slew rate of 3V/ $\mu$ s and a quiescent current of 0.75mA at wide power supply range.

The SGMOP07E is designed to provide optimal performance in low noise systems. It provides rail-to-rail output swing into heavy loads.

The single SGMOP07E is available in a Green SOIC-8 package. It is specified over the extended -40°C to +125°C temperature range.

### FEATURES

- Rail-to-Rail Output
- Low Bias Current:  $\pm 1\text{nA}$  (TYP)
- High Open-Loop Gain: 130dB at  $V_S = \pm 15\text{V}$
- High PSRR: 135dB
- Gain-Bandwidth Product: 600kHz
- Low Noise:  $8.5\text{nV}/\sqrt{\text{Hz}}$  at 1kHz
- Supply Voltage Range:  
3.6V to 36V or  $\pm 1.8\text{V}$  to  $\pm 18\text{V}$
- Input Common Mode Voltage Range:  
 $(-V_S) + 1.5\text{V}$  to  $(+V_S) - 2\text{V}$
- Low Quiescent Current: 0.75mA (TYP)
- -40°C to +125°C Operating Temperature Range
- Available in a Green SOIC-8 Package

### APPLICATIONS

Sensors  
Audio  
Active Filters  
A/D Converters  
Communications  
Test Equipment  
Cellular and Cordless Phones  
Laptops and PDAs  
Photodiode Amplification

## OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

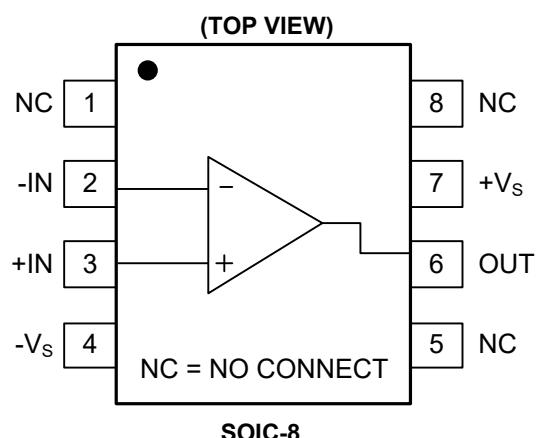

## ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

## APPLICATION NOTES

## Power Supply Bypassing and Layout

The SGMOP07E operates from either a single 3.6V to 36V supply or dual  $\pm 1.8V$  to  $\pm 18V$  supplies. For single-supply operation, bypass the power supply  $+V_S$  with a  $0.1\mu F$  ceramic capacitor which should be placed close to the  $+V_S$  pin. For dual-supply operation, both the  $+V_S$  and the  $-V_S$  supplies should be bypassed to ground with separate  $0.1\mu F$  ceramic capacitors.  $10\mu F$  tantalum capacitor can be added for better performance.

Good PC board layout techniques optimize performance by decreasing the amount of stray capacitance at the operational amplifier's inputs and output. To decrease stray capacitance, minimize trace lengths and widths by placing external components as close to the device as possible. Use surface-mount components whenever possible.

For the operational amplifier, soldering the part to the board directly is strongly recommended. Try to keep the high frequency current loop area small to minimize the EMI (electromagnetic interference).

## Grounding

A ground plane layer is important for SGMOP07E circuit design. The length of the current path in an inductive ground return will create an unwanted voltage noise. Broad ground plane areas will reduce the parasitic inductance.

## Input-to-Output Coupling

To minimize capacitive coupling, the input and output signal traces should not be in parallel. This helps reduce unwanted positive feedback.

## Differential Amplifier

The circuit shown in Figure 2 performs the difference function. If the resistor ratios are equal ( $R_4/R_3 = R_2/R_1$ ), then  $V_{OUT} = (V_P - V_N) \times R_2/R_1 + V_{REF}$ .

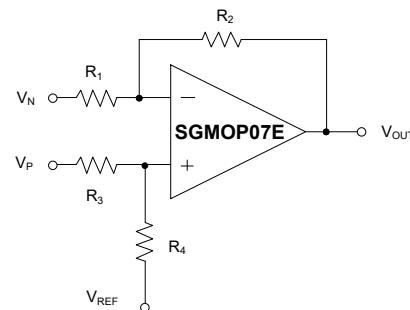

Figure 2. Differential Amplifier

## Instrumentation Amplifier

The circuit in Figure 3 performs the same function as that in Figure 2 but with a high input impedance.

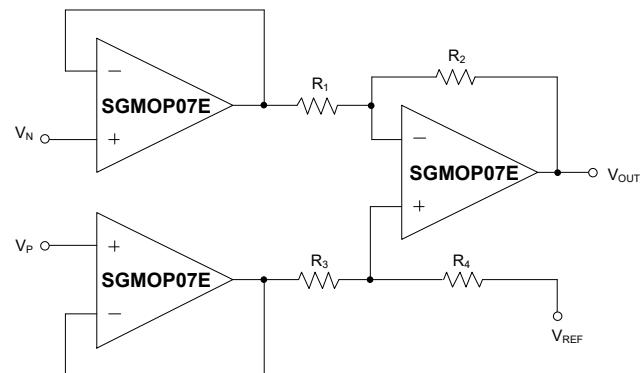

Figure 3. Instrumentation Amplifier

## Active Low-Pass Filter

The low-pass filter shown in Figure 4 has a DC gain of  $(-R_2/R_1)$  and the  $-3dB$  corner frequency is  $1/2\pi R_2 C$ . Make sure the filter bandwidth is within the bandwidth of the amplifier. Feedback resistors with large values can couple with parasitic capacitance and cause undesired effects such as ringing or oscillation in high-speed amplifiers. Keep resistor values as low as possible and consistent with output loading consideration.
