## 1µA Ultra Low Current Consumption and Low Dropout CMOS Voltage Regulators

### GENERAL DESCRIPTION

The SGM2040 series are positive voltage regulators with ultra low current consumption, low dropout voltage, high-accuracy output voltage and 250mA output current, developed in CMOS technology.

Input and output capacitors as small as 0.1µF can be used. The SGM2040 series operate with an ultra low current consumption, only 1µA typical current is consumed to prolong the battery used time.

The built-in low on-resistance transistor realizes low dropout voltage and a large output current. A built-in over-current protection circuit prevents the load current from exceeding the current capacity of the output transistor. Reverse current is less than 0.2µA (TYP) when  $V_{OUT} > V_{IN}$ .

Compared with voltage regulators using a conventional CMOS technology, more types of capacitors, including small input and output capacitors, can be used with the SGM2040 series. The SGM2040 series feature ultra low current consumption and come in small packages, making them most suitable for portable equipment.

The SGM2040 is available in Green UTDFN-1x1-4AL and SOT-23-5 packages. It operates over an ambient temperature range of -40°C to +85°C.

### FEATURES

- Output Voltage: 1.2V to 5.2V with 0.05V per Step
- Input Voltage: 1.7V to 7.5V
- High Output Voltage Accuracy
- Low Dropout Voltage
- Ultra Low Current Consumption: 1.0µA (TYP)
- 250mA Nominal Output Current
- Input and Output Capacitors:  
Ceramic Capacitors of 0.1µF or Higher can be Used
- Low Reverse Leakage Current when  $V_{OUT} > V_{IN}$
- Built-In Over-Temperature Protection
- Built-In Over-Current Protection Circuit
- Supports 1.8V Logic for EN Pin
- -40°C to +85°C Operating Temperature Range
- Available in Green SOT-23-5 and UTDFN-1x1-4AL Packages

### APPLICATIONS

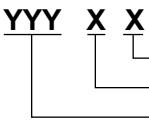

Wearable Device  
Smart Phone  
Portable Equipment

**NOTES:**

1. Maximum output current is affected by the PCB layout, size of metal trace, the thermal conduction path between metal layers, ambient temperature and the other environment factors of system. Attention should be paid to the dropout voltage when V<sub>IN</sub> < V<sub>OUT</sub> + V<sub>DROP</sub>.
2. Dropout voltage is characterized when V<sub>OUT</sub> falls 5% below V<sub>OUT(NOMINAL)</sub>.
3. Output voltage temperature coefficient is defined as the worst-case voltage change divided by the total temperature range.

## APPLICATION INFORMATION

## Standard Circuit

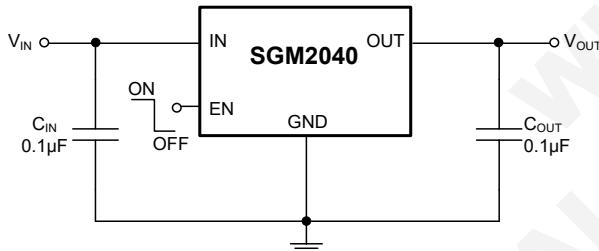

Figure 2. Standard Circuit

## Condition of Application

Input Capacitor ( $C_{IN}$ ): 0.1 $\mu$ F or higher

Output Capacitor ( $C_{OUT}$ ): 0.1 $\mu$ F or higher

Caution: Generally regulator may oscillate depending on the selection of external components.

Confirm that no oscillation occurs in the application for which the above capacitors are used.

## Selection of Input and Output Capacitors

The SGM2040 series require an output capacitor ( $C_{OUT}$ ) between the OUT pin and GND pin for phase compensation.

Operation is stable with a ceramic capacitor of 0.1 $\mu$ F or higher in the entire temperature range. When using an OS capacitor, a tantalum capacitor, or an aluminum

electrolytic capacitor, the capacitance must be 0.1 $\mu$ F or higher.

The value of the output overshoot or undershoot transient response varies depending on the value of the output capacitor.

The required capacitance of the input capacitor ( $C_{IN}$ ) differs depending on the application.

The recommended value for an application is  $C_{IN} \geq 0.1\mu F$ ,  $C_{OUT} \geq 0.1\mu F$ ; however, when selecting these capacitors, perform sufficient evaluation, including evaluation of temperature characteristics, on the actual device.

The SGM2040 series enable use of a low equivalent series resistance capacitor, such as a ceramic capacitor, for the output-side capacitor ( $C_{OUT}$ ).

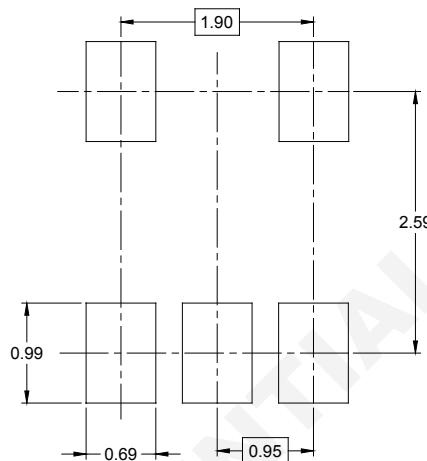

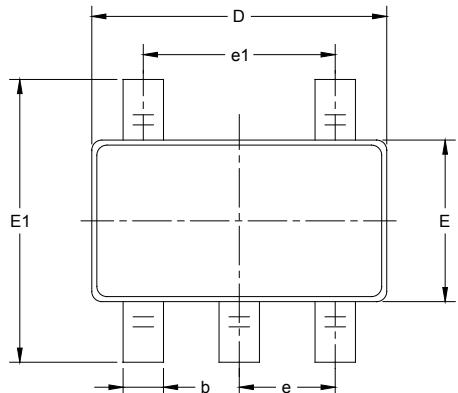

## Over-Current Protection Circuit

The SGM2040 series include an over-current protection circuit having the characteristics shown in the table of electrical characteristics, in order to protect the output transistor against an excessive output current and short circuiting between the OUT and GND pins. The current when the output pin is short-circuited ( $I_{SHORT}$ ) is internally set at approximately 86mA (TYP), and the normal value is restored for the output voltage, if the short circuit condition is released.
