

BL9198

300mA Ultra-low Noise, Ultra-Fast
CMOS LDO Regulator

FEATURES

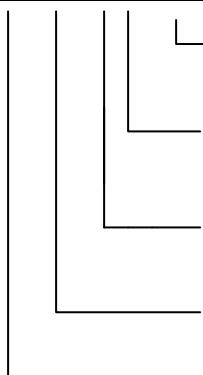

- Ultra-low Noise for RF Application
- Ultra-Fast Response in Line/Load Transient
- $<0.01\mu\text{A}$ Standby Current When Shutdown.
- Low Dropout: 210mV@300mA
- Wide Operating Voltage Ranges: 2V to 6V
- TTL-logic-Controlled Shutdown Input
- Low Temperature Coefficient
- Current Limiting Protection
- Thermal Shutdown Protection
- Only 1 μF Output Capacitor Required for Stability
- High Power Supply Rejection Ratio
- Custom Voltage Available
- Fast output discharge
- Available in 5-Lead SOT-23 and SC-70 Package

APPLICATIONS

- Cellular and Smart Phones
- Battery-Powered Equipment
- Laptop, Palmtops, Notebook Computers

ORDERING INFORMATION

BL9198 XX X X X XXX

Package:
RN: SOT-23-5
URN: SC-70-5

Features
P: Standard (default, lead free)
C: Customized

Enable Option:
A: active high with internal 8 M Ω pull down
B: active low with internal 8 M Ω pull up

Output Voltage Accuracy
A: $\pm 1\%$
B: $\pm 2\%$

Output Voltage:
12: 1.2V 13: 1.3V 15: 1.5V 18: 1.8V
25: 2.5V 27: 2.7V 28: 2.8V 285: 2.85V
30: 3.0V 32: 3.2V 33: 3.3V 50: 5.0V
CT: custom fixed output (50mV step)

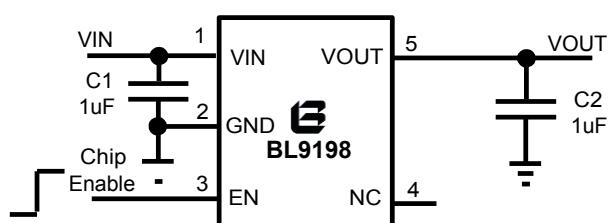

- Hand-Held Instruments
- PCMCIA Cards
- MP3/MP4/MP5 Players
- Portable Information Appliances

DESCRIPTION

The BL9198 is designed for portable RF and wireless applications with demanding performance and space requirements. The BL9198 performance is optimized for battery-powered systems to deliver ultra low noise and low quiescent current. Regulator ground current increases only slightly in dropout, further prolonging the battery life. The BL9198 also works with low-ESR ceramic capacitors, reducing the amount of board space necessary for power applications, critical in hand-held wireless devices. The BL9198 consumes less than 0.01 μA in shutdown mode and has fast turn-on time less than 50 μs . The other features include ultra low dropout voltage, high output accuracy, current limiting protection, and high ripple rejection ratio. Available in the 5-lead SC-70 and SOT-23 packages.

TYPICAL APPLICATION

BL9198 28 AA

Application hints:

Output capacitor ($C_2 \geq 2.2\mu\text{F}$) is recommended in BL9198-1.2V, BL9198-1.3V, BL9198-1.5V and BL9198-1.8V application to assure the stability of circuit.

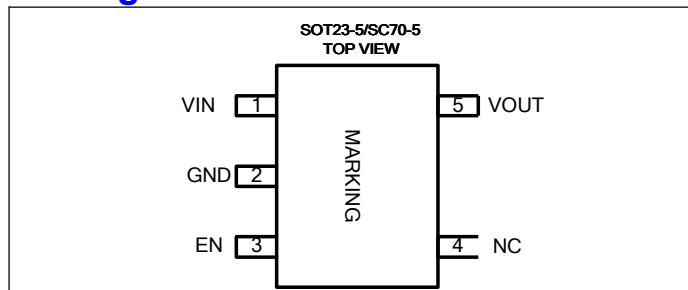

BL9198

300mA Ultra-low Noise, Ultra-Fast
CMOS LDO Regulator

Absolute Maximum Rating (Note 1)

| | | | |
|----------------------------|-------------------|---|----------------|
| Input Supply Voltage (VIN) | -0.3V to +6V | Maximum Junction Temperature | 150°C |
| EN Pin Input Voltage | -0.3V to VIN | Operating Temperature Range <small>(Note 2)</small> | -40°C to 85°C |
| Output Voltages | -0.3V to VIN+0.3V | Storage Temperature Range | -65°C to 125°C |
| Output Current | 300mA | Lead Temperature (Soldering, 10s) | 300°C |

Package Information

CMOS LDO Regulator

BL9198

300mA Ultra-low Noise, Ultra-Fast
CMOS LDO Regulator

Applications Information

Like any low-dropout regulator, the external capacitors used with the BL9198 must be carefully selected for regulator stability and performance. Using a capacitor whose value is $> 1\mu\text{F}$ on the BL9198 input and the amount of capacitance can be increased without limit. The input capacitor must be located a distance of not more than 0.5 inch from the input pin of the IC and returned to a clean analog ground. Any good quality ceramic or tantalum can be used for this capacitor. The capacitor with larger value and lower ESR (equivalent series resistance) provides better PSRR and line-transient response. The output capacitor must meet both requirements for minimum amount of capacitance and ESR in all LDOs application. The BL9198 is designed specifically to work with low ESR ceramic output capacitor in space-saving and performance consideration. Using a ceramic capacitor whose value is at least $1\mu\text{F}$ with ESR is $> 25\text{m}\Omega$ on the BL9198 output ensures stability. The BL9198 still works well with output capacitor of other types due to the wide stable ESR range. Output capacitor of larger capacitance can reduce noise and improve load transient response, stability, and PSRR. The output capacitor should be located not more than 0.5 inch from the V_{OUT} pin of the BL9198 and returned to a clean analog ground.

Enable Function

The BL9198 features an LDO regulator enable/disable function. To assure the LDO regulator will switch on; the EN turn on control level must be greater than 1.2 volts. The LDO regulator will go into the shut-

down mode when the voltage on the EN pin falls below 0.4 volts. For to protect the system, the BL9198 have a quick discharge function. If the enable function is not needed in a specific application, it may be tied to V_{IN} to keep the LDO regulator in a continuously on state.

Thermal Considerations

Thermal protection limits power dissipation in BL9198. When the operation junction temperature exceeds 165°C , the OTP circuit starts the thermal shutdown function turn the pass element off. The pass element turns on again after the junction temperature cools by 30°C .

For continue operation, do not exceed absolute maximum operation junction temperature 125°C . The power dissipation definition in device is:

$$P_{\text{D}}(\text{MAX}) = (T_{\text{J}}(\text{MAX}) - T_{\text{A}})/\theta_{\text{JA}}$$

Where $T_{\text{J}}(\text{MAX})$ is the maximum operation junction temperature 125°C , T_{A} is the ambient temperature and the θ_{JA} is the junction to ambient thermal resistance. For recommended operating conditions specification of BL9198, where $T_{\text{J}}(\text{MAX})$ is the maximum junction temperature of the die (125°C) and T_{A} is the maximum ambient temperature. The junction to ambient thermal resistance (θ_{JA} is layout dependent) for SOT-23-5 package is $250^{\circ}\text{C}/\text{W}$, SC-70-5 package is $333^{\circ}\text{C}/\text{W}$, on standard JEDEC 51-3 thermal test board. The maximum power dissipation at $T_{\text{A}}= 25^{\circ}\text{C}$ can be calculated by following formula:

$$P_{\text{D}}(\text{MAX}) = (125^{\circ}\text{C} - 25^{\circ}\text{C})/333 = 300\text{mW} \quad (\text{SC-70-5})$$

$$P_D(\text{MAX}) = (125^\circ\text{C} - 25^\circ\text{C})/250 = 400\text{mW}$$

(SOT-23-5)

The maximum power dissipation depends on operating ambient temperature for fixed $T_J(\text{MAX})$ and thermal resistance θ_{JA} . It is also useful to calculate the junction of temperature of the BL9198 under a set of specific conditions. In this example let the input voltage $V_{IN}=3.3\text{V}$, the output current $I_O=300\text{mA}$ and the case temperature $T_A=40^\circ\text{C}$ measured by a thermal couple during operation. The power dissipation for the $V_{OUT}=2.8\text{V}$ version of the BL9198 can be calculated as:

$$P_D = (3.3\text{V} - 2.8\text{V}) \times 300\text{mA} + 3.6\text{V} \times 100\mu\text{A}$$
$$= 150\text{mW}$$

And the junction temperature, T_J , can be calculated as follows:

$$T_J = T_A + P_D \times \theta_{JA} = 40^\circ\text{C} + 0.15\text{W} \times 250^\circ\text{C/W}$$
$$= 40^\circ\text{C} + 37.5^\circ\text{C} = 77.5^\circ\text{C} < T_J(\text{MAX}) = 125^\circ\text{C}$$

For this operating condition, T_J is lower than the absolute maximum operating junction temperature, 125°C , so it is safe to use the BL9198 in this configuration.

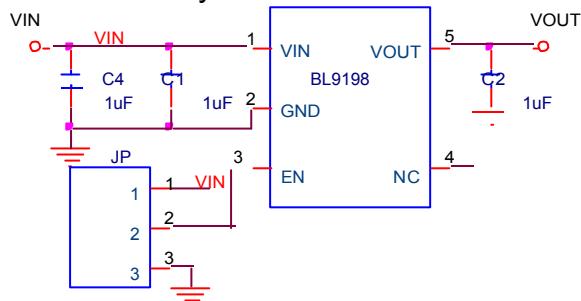

Layout considerations

To improve ac performance such as PSRR, output noise, and transient response, it is recommended that the PCB be designed with separate ground planes for V_{IN} and V_{OUT} , with each ground plane connected only at the GND pin of the device.
