

# SGM8295-1/SGM8295-2/SGM8295-4 9MHz, Low Noise, High Voltage, Precision Operational Amplifiers

---

## GENERAL DESCRIPTION

The SGM8295-1 (single), SGM8295-2 (dual) and SGM8295-4 (quad) are low noise, low offset voltage and high voltage operational amplifiers, which can be designed into a wide range of applications. The SGM8295-1/2/4 have a high gain-bandwidth product of 9MHz, a slew rate of 8V/ $\mu$ s, and a quiescent current of 1.5mA/amplifier at wide power supply range.

The SGM8295-1/2/4 are designed to provide optimal performance in low noise systems. They provide rail-to-rail output swing into heavy loads.

The single version SGM8295-1 is available in Green SOT-23-5 and SOIC-8 packages. The dual version SGM8295-2 is available in Green SOIC-8 and MSOP-8 packages. The quad version SGM8295-4 is available in Green SOIC-14 package. They are specified over the extended -40°C to +125°C temperature range.

## FEATURES

- **Low Noise:** 4.5nV/ $\sqrt{\text{Hz}}$
- **Rail-to-Rail Output**
- **Very Low Offset Voltage:** 250 $\mu$ V (MAX)
- **Low Bias Current:**  $\pm$ 1nA (TYP)
- **High Gain-Bandwidth Product:** 9MHz
- **High Slew Rate:** 8V/ $\mu$ s
- **High Open-Loop Gain:** 130dB at  $V_S = \pm$ 15V
- **High PSRR:** 145dB
- **Settling Time to 0.1% with 1V Step:** 1 $\mu$ s
- **Overload Recovery Time:** 10 $\mu$ s
- **Operating Voltage Range:**  
3.6V to 36V or  $\pm$ 1.8V to  $\pm$ 18V
- **Input Common Mode Voltage Range:**  
 $(-V_S) + 1.5V$  to  $(+V_S) - 2V$
- **Low Supply Current:**  
1.5mA/Amplifier (TYP)
- **-40°C to +125°C Operating Temperature Range**
- **Small Packaging:**  
SGM8295-1 Available in Green SOT-23-5 and SOIC-8 Packages  
SGM8295-2 Available in Green SOIC-8 and MSOP-8 Packages  
SGM8295-4 Available in Green SOIC-14 Package

## APPLICATIONS

CDM .....	1000V

**RECOMMENDED OPERATING CONDITIONS**

Supply Voltage Range .....	3.6V to 36V
Operating Temperature Range .....	-40°C to +125°C

**OVERSTRESS CAUTION**

Stresses beyond those listed may cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational section of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

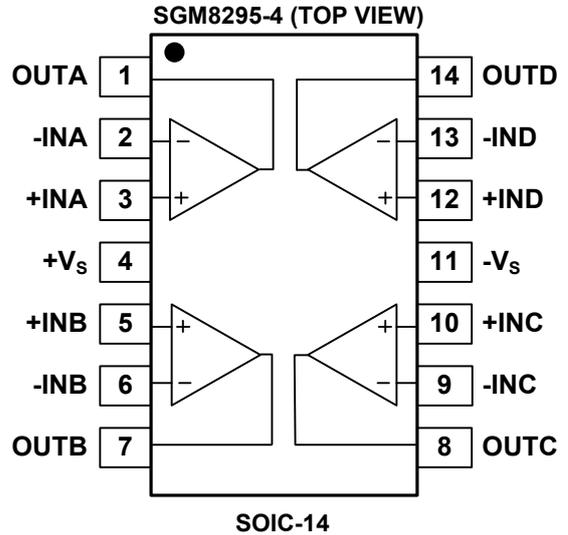

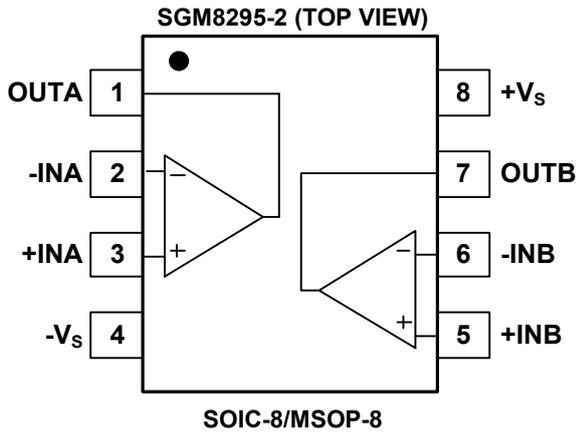

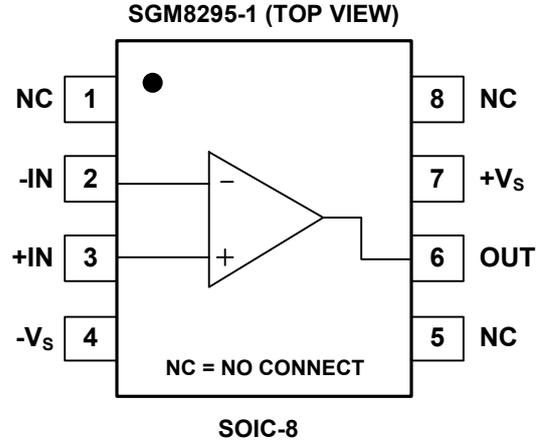

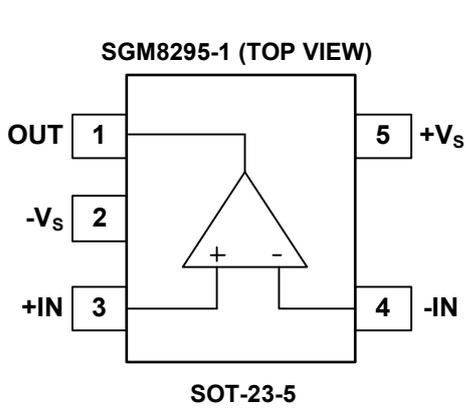

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

**DISCLAIMER**

**APPLICATION NOTES**

**Power-Supply Bypassing and Layout**

The SGM8295-1/2/4 operate from either a single 3.6V to 36V supply or dual  $\pm 1.8V$  to  $\pm 18V$  supplies. For single-supply operation, bypass the power supply  $+V_S$  with a  $0.1\mu F$  ceramic capacitor which should be placed close to the  $+V_S$  pin. For dual-supply operation, both the  $+V_S$  and the  $-V_S$  supplies should be bypassed to ground with separate  $0.1\mu F$  ceramic capacitors. A  $10\mu F$  tantalum capacitor can be added for better performance.

Good PCB layout techniques optimize performance by decreasing the amount of stray capacitance at the operational amplifier's inputs and output. To decrease stray capacitance, minimize trace lengths and widths by placing external components as close to the device as possible. Use surface-mount components whenever possible.

For the operational amplifier, soldering the part to the board directly is strongly recommended. Try to keep the high frequency current loop area small to minimize the EMI (electromagnetic interference).

**Figure 1. Amplifier with Bypass Capacitors**

**Grounding**

A ground plane layer is important for SGM8295-1/2/4 circuit design. The length of the current path in an inductive ground return will create an unwanted voltage noise. Broad ground plane areas will reduce the parasitic inductance.

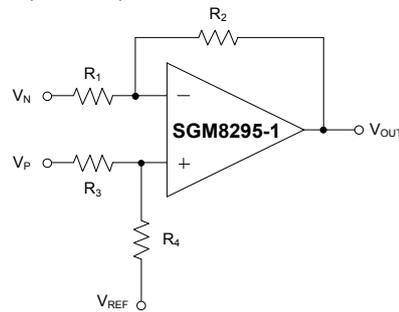

**Input-to-Output Coupling**

To minimize capacitive coupling, the input and output signal traces should not be in parallel. This helps reduce unwanted positive feedback.

**Differential Amplifier**

The circuit shown in Figure 2 performs the difference function. If the resistor ratios are equal ( $R_4/R_3 = R_2/R_1$ ),

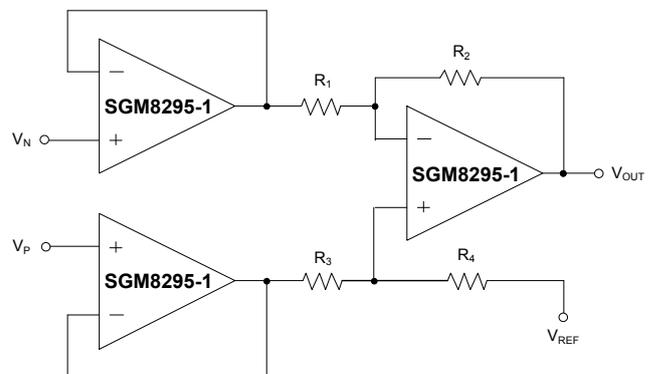

then  $V_{OUT} = (V_P - V_N) \times R_2/R_1 + V_{REF}$ .

**Figure 2. Differential Amplifier**

**Instrumentation Amplifier**

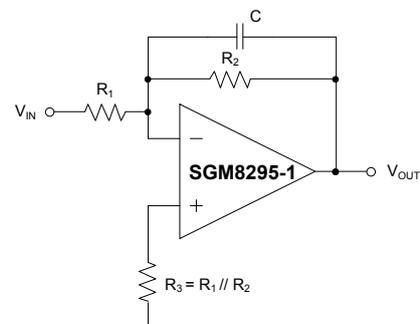

The circuit in Figure 3 performs the same function as that in Figure 2 but with a high input impedance.

**Figure 3. Instrumentation Amplifier**

**Active Low-Pass Filter**

The low-pass filter shown in Figure 4 has a DC gain of  $(-R_2/R_1)$  and the  $-3dB$  corner frequency is  $1/2\pi R_2 C$ . Make sure the filter bandwidth is within the bandwidth of the amplifier. Feedback resistors with large values can couple with parasitic capacitance and cause undesired effects such as ringing or oscillation in high-speed amplifiers. Keep resistor values as low as possible and consistent with output loading consideration.
