40V Precision Single Supply Rail-to-Rail Output Low Power Operational Amplifiers

The ISL28108, ISL28208 and ISL28408 are single, dual and quad low power precision amplifiers optimized for single supply applications. These devices feature a common mode input voltage range extending to 0.5V below the V- rail, a rail-to-rail differential input voltage range for use as a comparator, and rail-to-rail output voltage swing, which make them ideal for single supply applications where input operation at ground is important.

Added features include low offset voltage, and low temperature drift making them the ideal choice for applications requiring high DC accuracy. The output stage is capable of driving large capacitive loads from rail-to-rail for excellent ADC driving performance. The devices can operate for single or dual supply from 3V ($\pm 1.5V$) to 40V ($\pm 20V$) and are fully characterized at $\pm 5V$ and $\pm 15V$. The combination of precision, low power, and small footprint provide the user with outstanding value and flexibility relative to similar competitive parts.

Applications for these amplifiers include precision instrumentation, data acquisition, precision power supply control, and industrial control.

The ISL28108 single is offered in 8 Ld TDFN, MSOP and SOIC packages. The ISL28208 dual amplifier is offered in 8 Ld TDFN, MSOP, and SOIC packages. The ISL28408 is offered in 14 Ld SOIC package. All devices are offered in standard pin configurations and operate over the extended temperature range of -40°C to $+125^{\circ}\text{C}$.

Features

- Single or dual supply, rail-to-rail output and below ground (V-) input capability
- Rail-to-rail input differential voltage range for comparator applications
- Single supply range 3V to 40V
- Low current consumption ($V_S = \pm 5V$) 165 μA
- Low noise voltage 15.8nV/ $\sqrt{\text{Hz}}$
- Low noise current 80fA/ $\sqrt{\text{Hz}}$
- Low input offset voltage (ISL28108) 150 μV
- Superb temperature drift
 - Voltage offset TC 0.1 $\mu\text{V}/^{\circ}\text{C}$, Typ
- Low input bias current -13nA Typ
- Operating temperature range -40°C to $+125^{\circ}\text{C}$
- No phase reversal

Applications

- Precision instruments
- Medical instrumentation
- Data acquisition
- Power supply control
- Industrial process control

NOTES:

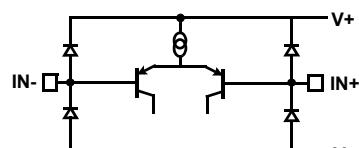

1. Add “-T*” suffix for tape and reel. Please refer to Tech Brief [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for [ISL28108](#), [ISL28208](#), [ISL28408](#). For more information on MSL please see Tech Brief [TB363](#).

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

4. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board in free air. See Tech Brief [TB379](#) for details.
5. θ_{JA} is measured in free air with the component mounted on a high effective thermal conductivity test board with "direct attach" features. See Tech Brief [TB379](#).
6. For θ_{JC} , the "case temp" location is the center of the exposed metal pad on the package underside.
7. For θ_{JC} , the "case temp" location is taken at the package top center.

IMPORTANT NOTE: All parameters having Min/Max specifications are guaranteed. Typical values are for information purposes only. Unless otherwise noted, all tests are at the specified temperature and are pulsed tests, therefore: $T_J = T_C = T_A$

Electrical Specifications, $V_S \pm 15$ $V_{CM} = 0, V_O = 0V, R_L = \text{Open}, T_A = +25^\circ C$, unless otherwise noted. Boldface entries apply over the operating temperature range, $-40^\circ C$ to $+125^\circ C$. Temperature data established by characterization.

Applications Information

Functional Description

The ISL28108, ISL28208, and ISL28408 are single, dual and quad, 1.2MHz, single supply rail-to-rail output amplifiers with a common mode input voltage range extending to a range of 0.5V below the V- rail. Their input stages are optimized for precision sensing of ground referenced signals in low voltage, single supply applications. The input stage has the capability of handling large input differential voltages without phase inversion making them suitable for high voltage comparator applications. Their bipolar design features high open loop gain and excellent DC input and output temperature stability. These op amps feature low quiescent current of 165 μ A, and a maximum temperature drift ranging from 1.1 μ V/ $^{\circ}$ C for the ISL28208 and ISL28408 in the SOIC package to 1.4 μ V/ $^{\circ}$ C for the ISL28208 in the TDFN package and the ISL28408 in the SOIC package (see Figures 11 through 20). All devices are fabricated in a new precision 40V complementary bipolar DI process and immune from latch-up.

Operating Voltage Range

The devices are designed to operate over the 3V (± 1.5 V) to 40V (± 20 V) range and are fully characterized at ± 5 V and ± 15 V. Both DC and AC performance remain virtually unchanged over the ± 5 V to ± 15 V operating voltage range. Parameter variation with operating voltage is shown in the "Typical Performance Curves" beginning on page 10.

Input Stage Performance

The PNP input stage has a common mode input range extending up to 0.5V below ground at $+25^{\circ}$ C (see Figures 23 and 24). Full amplifier performance is guaranteed down to ground (V-) over the -40° C to $+125^{\circ}$ C temperature range. For common mode voltages down to -0.5V the amplifiers are fully functional, but performance degrades slightly over the full temperature range. This feature provides excellent CMRR, AC performance and DC accuracy when amplifying low level ground referenced signals.

The input stage has a maximum input differential voltage equal to a diode drop greater than the supply voltage (max 42V) and does not contain the back-to-back input protection diodes found on many similar amplifiers. This feature enables the device to function as a precision comparator by maintaining very high input impedance for high voltage differential input comparator voltages. The high differential input impedance also enables the device to operate reliably in large signal pulse applications without the need for anti-parallel clamp diodes required on MOSFET and most bipolar input stage op amps. Thus, input signal distortion caused by nonlinear clamps under high slew rate conditions are avoided.

In applications where one or both amplifier input terminals are at risk of exposure to voltages beyond the supply rails, current limiting resistors may be needed at each input terminal (see Figure 65, R_{IN+} , R_{IN-}) to limit current through the power supply ESD diodes to 20mA.

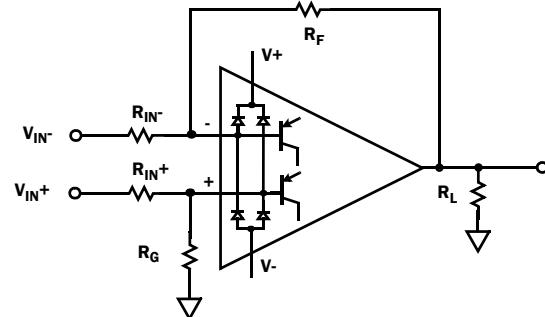

FIGURE 65. INPUT ESD DIODE CURRENT LIMITING

Output Drive Capability

The bipolar rail-to-rail output stage features low saturation levels that enable an output voltage swing to less than 10mV when the total output load (including feedback resistance) is held below 50 μ A (Figures 31 and 32). With ± 15 V supplies this can be achieved by using feedback resistor values >300 k Ω . The low input bias and offset currents (-43nA and ± 3 nA $+25^{\circ}$ C max respectively) minimize DC offset errors at these high resistance values. For example, a balanced 4 resistor gain circuit (Figure 65) with 1M Ω feedback resistors (R_F, R_G) generates a worst case input offset error of only ± 3 mV. Furthermore, the low noise current reduces the added noise associated with high feedback resistance.

The output stage is internally current limited. Output current limit over-temperature is shown in Figures 37 and 38. The amplifiers can withstand a short circuit to either rail as long as the power dissipation limits are not exceeded. This applies to only one amplifier at a time for the dual op amp. Continuous operation under these conditions may degrade long-term reliability.

The amplifiers perform well driving capacitive loads (Figures 60 and 61). The unity gain, voltage follower (buffer) configuration provides the highest bandwidth, but is also the most sensitive to ringing produced by load capacitance found in BNC cables. Unity gain overshoot is limited to 30% at capacitance values to 0.33nF. At gains of 10 and higher, the device is capable of driving more than 10nF without significant overshoot.

Output Phase Reversal

Output phase reversal is a change of polarity in the amplifier transfer function when the input voltage exceeds the supply voltage. These devices are immune to output phase reversal, out to 0.5V beyond the rail (V_{ABS MAX}) limit (see Figure 40).

Unused Channels

If the application requires only one channel, the user must configure any unused channel to prevent it from oscillating. Unused channels can oscillate if the input and output pins are floating. This will result in higher-than-expected supply currents and possible noise injection into the channel being used. The proper way to prevent oscillation is to short the output to the inverting input, and ground the positive input (Figure 66).

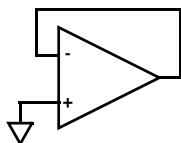

FIGURE 66. PREVENTING OSCILLATIONS IN UNUSED CHANNELS

Power Dissipation

It is possible to exceed the $+150^{\circ}\text{C}$ maximum junction temperatures under certain load and power supply conditions. It is therefore important to calculate the maximum junction temperature (T_{JMAX}) for all applications to determine if power supply voltages, load conditions, or package type need to be modified to remain in the safe operating area. These parameters are related using Equation 1:

$$T_{JMAX} = T_{MAX} + \theta_{JA} \times PD_{MAXTOTAL} \quad (\text{EQ. 1})$$

where:

- $PD_{MAXTOTAL}$ is the sum of the maximum power dissipation of each amplifier in the package (PD_{MAX})
- PD_{MAX} for each amplifier can be calculated using Equation 2:

$$PD_{MAX} = V_S \times I_{qMAX} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L} \quad (\text{EQ. 2})$$

where:

- T_{MAX} = Maximum ambient temperature
- θ_{JA} = Thermal resistance of the package
- PD_{MAX} = Maximum power dissipation of 1 amplifier
- V_S = Total supply voltage
- I_{qMAX} = Maximum quiescent supply current of 1 amplifier
- V_{OUTMAX} = Maximum output voltage swing of the application
- R_L = Load resistance

ISL28108, ISL28208, ISL28408 SPICE Model

Figure 67 shows the SPICE model schematic and Figure 68 shows the net list for the SPICE model. The model is a simplified version of the actual device and simulates important AC and DC parameters. AC parameters incorporated into the model are: 1/f and flat band noise voltage, Slew Rate, CMRR, Gain and Phase. The DC parameters are I_{OS} , total supply current and output voltage swing. The model uses typical parameters given in the "Electrical Specifications" Table beginning on page 6. The AVOL is adjusted for 122dB with the dominant pole at 1Hz. The CMRR is set 128dB, $f = 6\text{kHz}$. The input stage models the actual device to present an accurate AC representation. The model is configured for ambient temperature of $+25^{\circ}\text{C}$.

Figures 69 through 83 show the characterization vs simulation results for the Noise Voltage, Open Loop Gain Phase, Closed Loop Gain vs Frequency, Gain vs Frequency vs R_L , CMRR, Large Signal 10V Step Response, Small Signal 0.05V Step and Output Voltage Swing $\pm 15\text{V}$ supplies.

*ISL28108_208 Macromodel - covers following products
 *ISL28108
 *ISL28208
 *ISL28408
 *

*Revision History:
 * Revision B, LaFontaine January 22 2014
 * Model for Noise, supply currents, CMRR
 *128dB f=6kHz ,AVOL 122dB f=1Hz
 * SR = 0.45V/us, GBWP 1.2MHz.
 *Copyright 2011 by Intersil Corporation
 *Refer to data sheet "LICENSE STATEMENT"
 *Use of this model indicates your acceptance
 *with the terms and provisions in the License
 *Statement.
 *

*Intended use:
 *This Pspice Macromodel is intended to give
 *typical DC and AC performance characteristics
 *under a wide range of external circuit
 *configurations using compatible simulation
 *platforms – such as iSim PE.
 *

*Device performance features supported by this model
 *Typical, room temp., nominal power supply
 *voltages used to produce the following
 *characteristics:
 *Open and closed loop I/O impedances,
 *Open loop gain and phase,
 *Closed loop bandwidth and frequency
 *response,
 *Loading effects on closed loop frequency
 *response,
 *Input noise terms including 1/f effects,
 *Slew rate,
 *Input and Output Headroom limits to I/O
 *voltage swing,
 *Supply current at nominal specified supply
 *voltages.
 *

*Device performance features NOT supported by this model:
 *Harmonic distortion effects,
 *Output current limiting (current will limit at ~40mA),
 *Disable operation (if any),
 *Thermal effects and/or over temperature
 *parameter variation,
 *Limited performance variation vs. supply
 *voltage is modeled,
 *Part to part performance variation due to
 *normal process parameter spread,
 *Any performance difference arising from
 *different packaging source,
 *Load current reflected into the power supply
 *current.

April 20, 2011	FN6935.2	<ul style="list-style-type: none"> Added discussion of ISL28408 throughout datasheet. On page 3 in "Ordering Information": Added new part, "ISL28408FBZ". Corrected part marking for ISL28208FRTZ from 208Z to 208F. Added "ISL28408" to Note 3. Under "Pin Configurations," added ISL28408 (14 Ld SOIC) pin configuration diagram. On page 5: in Pin Descriptions table, added column for ISL28408 14Ld SOIC. Corrected schematic for Circuit 2. On page 6: under "Thermal Information" added "14 Ld SOIC Package (408, Notes 4, 7)" and added ISL28108 to 8 Ld TDFN and 8 Ld MSOP. Changed θ_{JA} and θ_{JC} for 8 Ld TDFN Package from 48 and 5.5 to 47 and 6. Added Note 6 regarding θ_{JC} "case temp" measurement, and applied it to 8 Ld TDFN Package. On page 6: in Electrical Specifications table, changed TYP spec for T_{CLB} from 70 pA/$^{\circ}$ C to 0.07nA/$^{\circ}$ C. On page 8, changed TYP spec for T_{CLB} from -67 pA/$^{\circ}$ C to -0.067nA/$^{\circ}$ C. These are not spec changes since the values are the same. On page 14, Figs. 31 and 32: changed y axis units label from (mV) to (V); changed x axis units label from (μA) to (mA). On page 21, under "Output Drive Capability," para 2, changed "The output stage can swing at moderate levels of output current (Figures 21 and 22) and the output stage is internally current limited. Output current limit over-temperature..." to "The output stage is internally current limited. Output current limit over-temperature..."
March 11, 2011	FN6935.1	<ul style="list-style-type: none"> On page 1, in the first paragraph - added the following after V-rail: "a rail-to-rail differential input voltage range for use as a comparator,..." On page 1 in "Features": <ul style="list-style-type: none"> - Added bullet - "Rail-to-rail input differential voltage range for comparator applications" - Changed Low Noise Current from "100fA/sq.root Hz" to "80fA/sq.root Hz" On page 3 in "Ordering Information" - Removed "coming soon" from ISL28208FRTZ part since it is releasing. On page 6, changed "ESD Tolerance (ISL28108, ISL28408)" as follows: <ul style="list-style-type: none"> - Human Body Model changed from "3kV" to "6kV" - Machine Model changed from "300V" to "400V" - Added JEDEC Test information for all ESD ratings On page 6 and page 8, added test conditions for SOIC TCVos specs. Added TCVos specs for TDFN. On page 7 changed "Noise Current Density" Typical from "100" to "80" On page 21, updated Applications Information Functional Description On page 21 Updated Input Stage Performance Section On page 21 Updated Output Drive Capability Section On page 22 Added ISL28108 AND ISL28208 SPICE MODEL and License Agreement section On page 23 Added SPICE NET LIST On page 25 Added Characterization vs Simulation Results curves
February 16, 2011	FN6935.0	Initial Release

Package Outline Drawing

M8.15E

8 LEAD NARROW BODY SMALL OUTLINE PLASTIC PACKAGE

Rev 0, 08/09

NOTES:

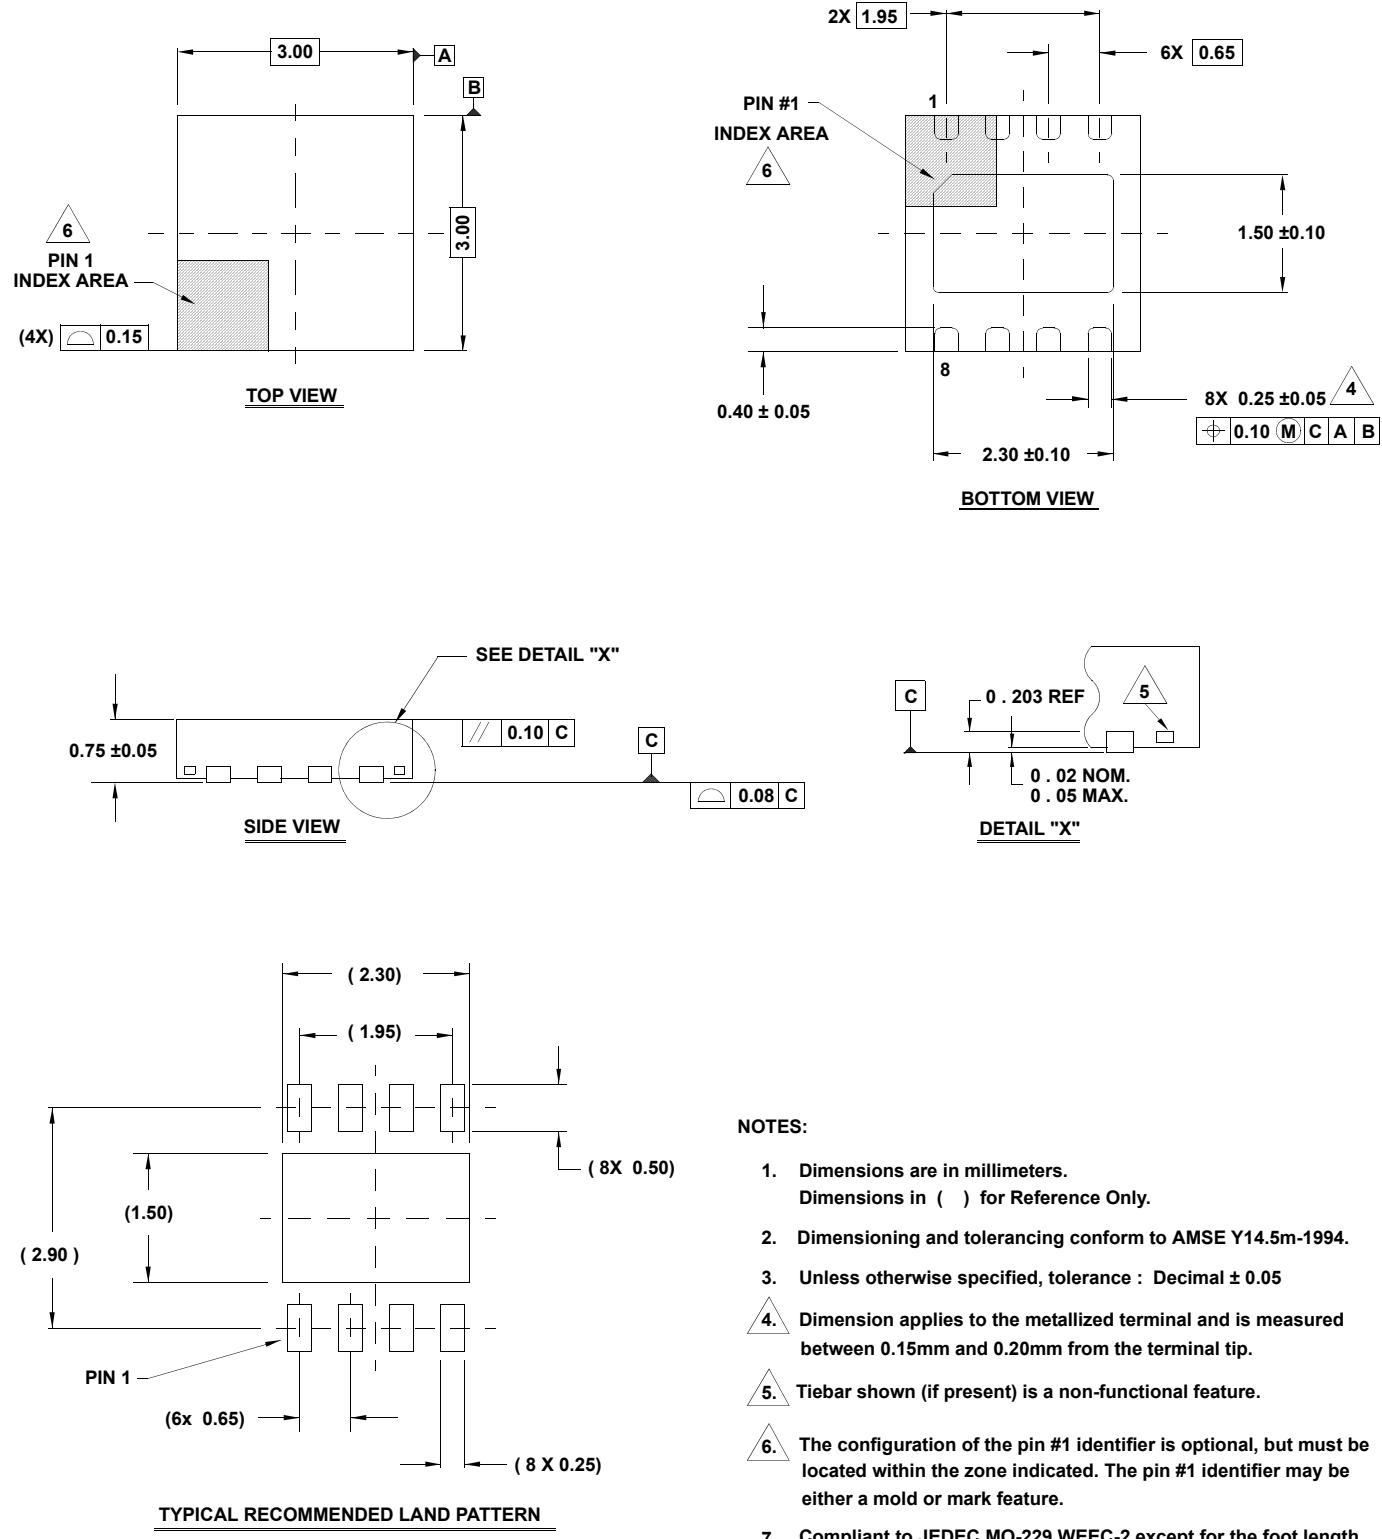

- Dimensions are in millimeters.
Dimensions in () for Reference Only.
- Dimensioning and tolerancing conform to AMSE Y14.5m-1994.
- Unless otherwise specified, tolerance : Decimal ± 0.05
- Dimension does not include interlead flash or protrusions.
Interlead flash or protrusions shall not exceed 0.25mm per side.
- The pin #1 identifier may be either a mold or mark feature.
- Reference to JEDEC MS-012.

8 LEAD MINI SMALL OUTLINE PLASTIC PACKAGE

Rev 1, 3/12

TYPICAL RECOMMENDED LAND PATTERN

NOTES:

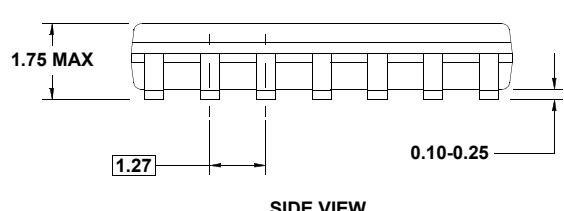

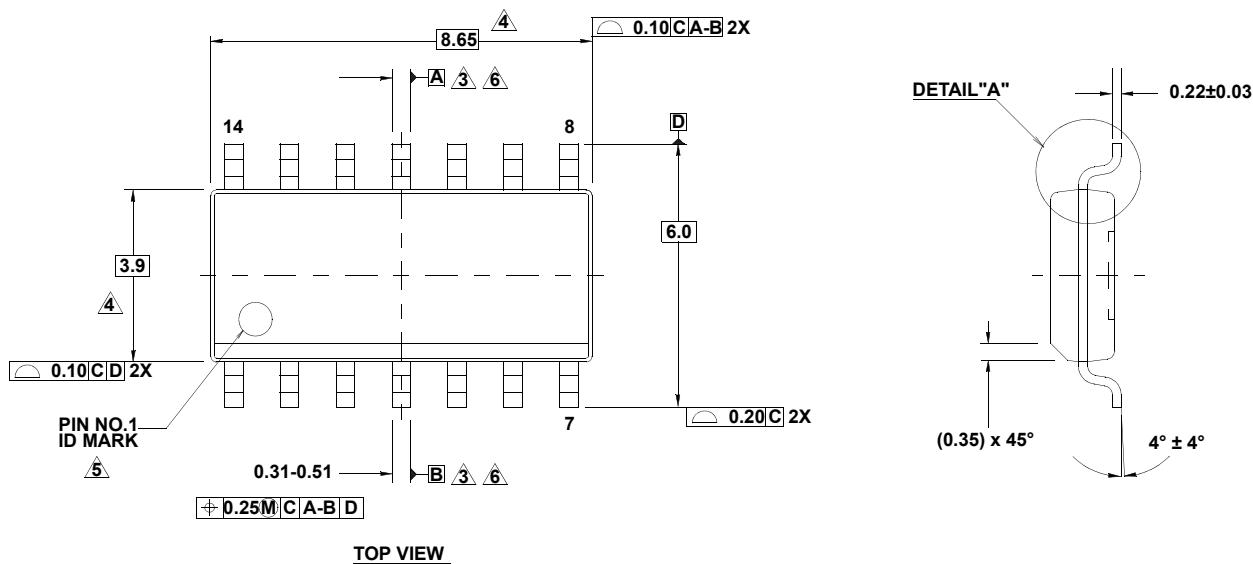

1. Dimensions are in millimeters.
2. Dimensioning and tolerancing conform to JEDEC MO-187-AA and AMSEY14.5m-1994.
3. Plastic or metal protrusions of 0.15mm max per side are not included.
4. Plastic interlead protrusions of 0.15mm max per side are not included.
5. Dimensions are measured at Datum Plane "H".
6. Dimensions in () are for reference only.

DETAIL "A"

TYPICAL RECOMMENDED LAND PATTERN

NOTES:

1. Dimensions are in millimeters.
Dimensions in () for Reference Only.
 2. Dimensioning and tolerancing conform to AMSEY14.5m-1994.
 3. Datums A and B to be determined at Datum H.
 4. Dimension does not include interlead flash or protrusions.
Interlead flash or protrusions shall not exceed 0.25mm per side.
 5. The pin #1 identifier may be either a mold or mark feature.
 6. Does not include dambar protrusion. Allowable dambar protrusion shall be 0.10mm total in excess of lead width at maximum condition.
 7. Reference to JEDEC MS-012-AB.
