

# SGM2212

## 800mA, Low Noise, Low Quiescent Current, High PSRR, Low Dropout Linear Regulator

### GENERAL DESCRIPTION

The SGM2212 is a low noise, low quiescent current, high PSRR, fast transient response and low dropout voltage linear regulator which is designed using CMOS technology. It provides 800mA output current capability. The operating input voltage range is from 2.7V to 20V. The fixed output voltages are 1.8V, 2.5V, 2.8V, 3.3V, 5V and adjustable output voltage range is from 1.25V to 15V.

Other features include short-circuit current limit and thermal shutdown protection.

The SGM2212 is available in Green TO-252-2, TO-263-3, SOT-223-3 and TDFN-3×3-8L packages. It operates over an operating temperature range of -40°C to +125°C.

### FEATURES

- **Input Voltage Range: 2.7V to 20V**
- **Output Current: 800mA**
- **Fixed Output Voltages: 1.8V, 2.5V, 2.8V, 3.3V, 5V**
- **Adjustable Output Voltage Range: 1.25V to 15V**
- **Output Voltage Accuracy: ±1% at +25°C**
- **Line Regulation: 0.012% (MAX)**
- **Load Regulation: 0.4% (MAX)**
- **Stable with Small Case Size Ceramic Capacitors**
- **Output Current Limit**
- **Thermal Shutdown Protection**
- **-40°C to +125°C Operating Temperature Range**
- **Available in Green TO-252-2, TO-263-3, SOT-223-3 and TDFN-3×3-8L Packages**

### APPLICATIONS

- Portable Electronic Device
- Battery-Powered Equipment
- Industrial and medical Equipment
- Post Regulator for Switching DC/DC Converters

### TYPICAL APPLICATION

Fixed Voltage Typical Application Circuit

Adjustable Voltage Typical Application Circuit

**OVERSTRESS CAUTION**

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

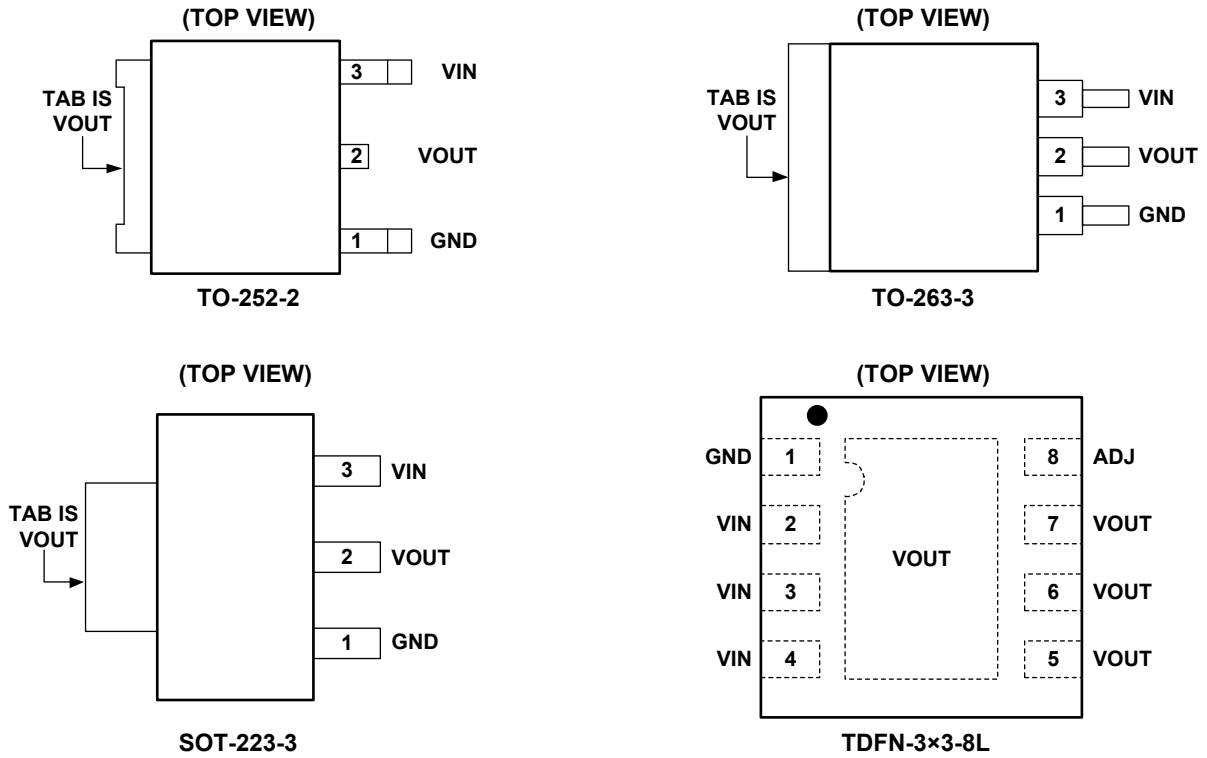

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

**DISCLAIMER**

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

**PIN CONFIGURATIONS**

**PIN DESCRIPTION**

PIN				NAME	FUNCTION
TO-252-2	TO-263-3	SOT-223-3	TDFN-3x3-8L		
1	1	1	1	GND	Ground.
2	2	2	5, 6, 7	VOUT	Regulator Output Pin. It is recommended to use an output capacitor with effective capacitance in the range of 1μF to 10μF. Pins 5, 6 and 7 must be connected together for TDFN-3x3-8L package.
3	3	3	2, 3, 4	VIN	Input Voltage Supply Pin. Pins 2, 3 and 4 must be connected together for TDFN-3x3-8L package.
-	-	-	8	ADJ	Feedback Input Pin (adjustable voltage version only). Connect this pin to the external resistor divider to adjust the output voltage. Place the resistors as close as possible to this pin.
TAB	TAB	TAB	Exposed Pad	VOUT	Exposed Pad. Connected to VOUT pin.

## APPLICATION INFORMATION

The SGM2212 is a low noise, fast transient response high performance LDO, it consumes only 80µA (TYP) quiescent current and provides 800mA output current. The SGM2212 provides the protection function for output overload, output short-circuit condition and overheating.

The SGM2212 is suitable for application which has noise sensitive circuit such as battery-powered equipment and smartphones.

### Input Capacitor Selection (C<sub>IN</sub>)

The input decoupling capacitor is necessary to be connected as close as possible to the VIN pin for ensuring the device stability. 2.2µF or greater X7R or X5R ceramic capacitor is selected to get good dynamic performance.

When V<sub>IN</sub> is required to provide large current instantaneously, a large effective input capacitor is required. Multiple input capacitors can limit the input tracking inductance. Adding more input capacitors is available to restrict the ringing and to keep it below the device absolute maximum ratings.

### Output Capacitor Selection (C<sub>OUT</sub>)

The output decoupling capacitor should be located as close as possible to the VOUT pin. A 2.2µF or greater X7R or X5R ceramic capacitor is selected to get good dynamic performance. The minimum effective capacitance of C<sub>OUT</sub> that SGM2212 can remain stable is 1µF. For ceramic capacitor, temperature, DC bias and package size will change the effective capacitance, so enough margin of C<sub>OUT</sub> must be considered in design. Larger capacitance and lower ESR C<sub>OUT</sub> will help improve the load transient response and increase the high frequency PSRR.

### Adjustable Regulator

The output voltage of the SGM2212 can be adjusted from 1.25V to 15V. The ADJ pin will be connected with two external resistors as shown in Figure 4, the output voltage is determined by the following equation:

$$V_{OUT} = V_{FB} \times \left( 1 + \frac{R_1}{R_2} \right) \quad (1)$$

where:

V<sub>OUT</sub> is output voltage and V<sub>FB</sub> is the internal voltage reference, V<sub>FB</sub> = 1.25V.

Figure 4. Adjustable Output Voltage Application

R<sub>1</sub> and R<sub>2</sub> can be calculated for any output voltage range using Equation 1. Choose R<sub>2</sub> = 10kΩ to maintain an 125µA minimum load.

### Output Current Limit and Short-Circuit Protection

When overload events happen, the output current is internally limited to 1100mA (TYP). When the OUT pin is shorted to ground, the short-circuit protection will limit the output current to 360mA (TYP).

### Power Dissipation (P<sub>D</sub>)

Thermal protection limits power dissipation in the SGM2212. When power dissipation on pass element (P<sub>D</sub> = (V<sub>IN</sub> - V<sub>OUT</sub>) × I<sub>OUT</sub>) is too much that raise the operation junction temperature exceeds +165°C, the OTP circuit starts the thermal shutdown function and turns the pass element off.

Therefore, thermal analysis for the chosen application is important to guarantee reliable performance over all conditions. To guarantee reliable operation, the junction temperature of the SGM2212 must not exceed +125°C.

In order to calculate the maximum power that the device can dissipate, the following formula is used:

$$P_{D(MAX)} = (125^\circ\text{C} - T_A) / \theta_{JA} \quad (2)$$

where T<sub>A</sub> is the ambient temperature, and θ<sub>JA</sub> is the junction-to-ambient thermal resistance.

**APPLICATION INFORMATION (continued)**

**Thermal Shutdown**

The SGM2212 can detect the temperature of die. When the die temperature exceeds the threshold value of thermal shutdown, the SGM2212 will be in shutdown state and remain in this state until the die temperature decreases to +140°C.

**Input Power Supply**

The input power supply range is from 2.7V to 20V.  $V_{IN}$  must be larger than  $(V_{OUT} + V_{DROP})$  in application. The input ceramic capacitor must be placed as close as possible to the IN pin, this  $C_{IN}$  can help improve the output noise performance of LDO.

**Layout Guidelines**

To get good PSRR, low output noise and high transient response performance, the input and output bypass capacitors must be placed as close as possible to the VIN pin and VOUT pin separately.  $V_{IN}$  and  $V_{OUT}$  had better use separate ground planes and these ground planes are single point connected to the GND pin.
