## WUSB3801

## USB Type-C Configuration Channel Flippable Adapter

### Description

The WUSB3801 is a Type-C Configuration Channel (CC) Flippable Adapter chip with low power and high efficiency. The WUSB3801 supports channel identification of USB Type-C connector and auto detection of different power roles based on chip settings. This chip is compatible with USB Type-C Cable and Connector Specification Release 1.2 for varies of applications.

The WUSB3801 supports PIN control mode and I<sup>2</sup>C control mode through CTRL pin settings, and re-uses SDA (INOUT1)/SCL (INOUT2)/INTB (OUT3) pins to realize necessary functions in different control modes. ROLE pin is used for Source (SRC)/Sink (SNK)/Dual Role Power (DRP) mode selection of Type-C logic working state. The global enable signal comes from ENB pin with internal pull-up resistor for more feasibility.

## Applications

- Smart-phones
- Laptops
- Tablets

#### http//:www.willsemi.com

#### Features

- USB Type-C Cable and Connector
   Specification Release 1.2 compatible
- Global power saving and active mode
- Pin or I<sup>2</sup>C controllable
- Support auto CC ports configuration
- Support SRC/SNK/DRP power mode
- Support DRP with Try.SNK or Try.SRC
- Support different current model controls and identifications (Default, 1.5A and 3.0A)
- Accurate internal CC termination resistance and current source with high precision
- High voltage EOS protection and DC 25V tolerance on CC1, CC2 and VBUSD pins
- Wide single power supply range: 2.7 ~ 5.5V
- QFN1616-12L packaging available (1.6x1.6x0.35mm)

**Table 4. Electrical Characteristics** 

## **Function Descriptions**

#### **General Description**

The WUSB3801 is a Type-C Configuration Channel Flippable Adapter chip with low power and high efficiency. The WUSB3801 supports channel identification of USB Type-C connector and auto detection of different power roles based on chip settings. It has high voltage protection circuits on CC1/CC2/VBUSD pins and supports both DC up to 25V and AC lighting surge. This chip is compatible with USB Type-C Cable and Connector Specification Release 1.2 for varies of applications.

#### **Logic Control Block**

The logic control block receives the outer control signals, detects CC connection status using voltage level comparisons of CC pins for different connection topologies and settings, and outputs the detected information of communication path. Comparison results showing CC signals voltage range are sent to logic control block for state machine and then the connection status of related working mode will be identified. When connection status changes, the logic control block will update outputs of pins and registers. The figures as below show the boundaries of status.

Threshold of Comparison and Status Relationship

#### Work Mode Feature

According to CC connection status and detection results, the chip can work as SRC (Host), SNK (Device) or DRP mode which are shown in the following figures.

**SRC State Diagram** 

SNK with Accessory Support State Diagram

DRP with Accessory and Try.SRC Support State Diagram

DRP with Accessory and Try.SNK Support State Diagram

#### **Communication Interfaces**

#### I<sup>2</sup>C Interface

The chip can take communications over I<sup>2</sup>C bus which supports up to 400 kHz clock when CTRL pin is not floating (connected to VDD or GND). Two setting values would result in different I<sup>2</sup>C device addresses as shown in Table 7.

	Pin Setting	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1
Address 1	VDD	1	1	0	1	0	0	0
Address 2	GND	1	1	0	0	0	0	0

Table 9. I<sup>2</sup>C Register Map

## **Function Description**

Registers are used for read/write settings in I2C control mode.

Status of USB Type-C connector is detected and updated in register map automatically by internal state machine. When any update occurs in register map after the last I2C reads, the chip would keep the interruption pin (INTB) at low level. Otherwise, the chip would cancel the interruption signal (INTB=1).
