

## LP5907 250mA 超低噪声、低 $I_Q$ LDO

### 1 特性

- 输入电压范围：2.2V 至 5.5V
- 输出电压范围：1.2V 至 4.5V
- 与  $1\mu\text{F}$  陶瓷输入和输出电容搭配使用，性能稳定
- 无需噪声旁路电容
- 支持输出电容远端布置
- 热过载保护和短路保护
- 运行结温范围：-40°C 至 125°C
- 低输出电压噪声： $< 6.5\mu\text{V}_{\text{RMS}}$
- 电源抑制比 (PSRR)：1kHz 频率时为 82dB
- 输出电压容差： $\pm 2\%$
- 极低  $I_Q$ （启用）： $12\mu\text{A}$
- 低压降：120mV（典型值）
- 使用 LP5907 并借助 WEBENCH® 电源设计器创建定制设计方案

### 2 应用

- 移动电话、平板电脑
- 数码相机和音频设备
- 便携式和电池供电类设备
- 便携式医疗设备
- 智能仪表和现场变送器
- RF、PLL、VCO 和时钟电源
- IP 摄像机
- 无人机

### 3 说明

LP5907 是一款能提供高达 250mA 输出电流的低噪声 LDO。此器件专门针对射频和模拟电路而设计，可满足其低噪声、高 PSRR、低静态电流以及低线路或负载瞬态响应系数等诸多要求。LP5907 采用创新的设计技术，无需噪声旁路电容便可提供出色的噪声性能，并且支持远距离安置输出电容。

此器件可与  $1\mu\text{F}$  输入和  $1\mu\text{F}$  输出陶瓷电容搭配使用（无需独立的噪声旁路电容）。

其固定输出电压介于 1.2V 至 4.5V 之间（阶跃为 25mV）。如需特定的电压选项，请联系德州仪器 (TI) 销售代表。

器件信息<sup>(1)</sup>

器件型号	封装	封装尺寸
LP5907	DSBGA (4)	0.675mm x 0.675mm (最大值)
	SOT-23 (5)	2.90mm x 1.60mm (标称值)
	X2SON (4)	1.00mm x 1.00mm (标称值)

(1) 如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

## 4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

### Changes from Revision M (January 2018) to Revision N

- |   | Page |
|---|------|
| • Added <i>Overshoot on start-up with EN</i> row to <i>Electrical Characteristics</i> table ..... | 7    |

### Changes from Revision L (August 2016) to Revision M

- |                           | Page |
|---------------------------|------|
| • 已添加 WEBENCH 的链接.....    | 1    |
| • 已添加 关于 YKM 封装选项的信息..... | 1    |
| • 已添加 细微的编辑性更改 .....      | 1    |

### Changes from Revision K (May 2016) to Revision L

- |   |   |
|---|---|
| • 已更改 更改了数据表标题，更新了应用列表以及“说明”部分第一句的措辞.....             | 1 |
| • 已更改 “ $10\mu V_{RMS}$ ”改为“ $6.5\mu V_{RMS}$ ” ..... | 1 |

### Changes from Revision J (March 2016) to Revision K

- |  |   |
|--|---|
| • 已更改 标题和“说明”部分第一句中的“线性稳压器”改为“LDO” ..... | 1 |
|--|---|

### Changes from Revision I (August 2015) to Revision J

- |  |   |
|--|---|
| • Changed $V_{OUT}$ min and max values and $V_{EN}$ min value in Abs Max table and $V_{EN}$ row of ROC table to correct format errors; replace text of footnote 2 of Abs Max table ..... | 5 |
|--|---|

### Changes from Revision H (November 2014) to Revision I

- |   |   |
|---|---|
| • 已添加 顶部导航增加了参考设计图标，并将“ $\Delta V_{OUT}$ 与温度间的关系”图添加到了典型特性 .....  | 1 |
| • Changed Storage Temperature to Abs Max table; replace <i>Handling Ratings</i> with <i>ESD Ratings</i> ..... | 5 |
| • Deleted " $V_{OUT} \geq 1.8$ V" from first row of $\Delta V_{OUT}$ spec .....                               | 6 |

- 
- Added "SOT-23, X2SON packages" to second row of  $\Delta V_{out}$  spec ..... 6

---

Changes from Revision G (October 2013) to Revision H	Page
• 已添加 器件信息 表和处理额定值 表, 特性 描述、器件功能模式、应用和实施、电源相关建议、布局、器件和文档支 持以及机械、封装和可订购信息 部分; 已将一些曲线移至应用曲线 部分。 ..... 1	1

## 5 Pin Configuration and Functions

## **YKE and YKM Packages 4-Pin DSBGA**

## Pin Functions: DSBGA

PIN		I/O	DESCRIPTION
DSBGA NUMBER	NAME		
A1	IN	I	Input voltage supply. Connect a 1- $\mu$ F capacitor at this input.
A2	OUT	O	Regulated output voltage. Connect a minimum 1- $\mu$ F low-ESR capacitor to this pin. Connect this output to the load circuit. An internal 230- $\Omega$ (typical) pulldown resistor prevents a charge remaining on $V_{OUT}$ when the regulator is in the shutdown mode ( $V_{EN}$ low).
B1	EN	I	Enable input. A low voltage ( $< V_{IL}$ ) on this pin turns the regulator off and discharges the output pin to GND through an internal 230- $\Omega$ pulldown resistor. A high voltage ( $> V_{IH}$ ) on this pin enables the regulator output. This pin has an internal 1-M $\Omega$ pulldown resistor to hold the regulator off by default.
B2	GND	—	Common ground

**DQN Package  
4-Pin X2SON

## Pin Functions: X2SON, SOT-23

PIN			I/O	DESCRIPTION
NAME	X2SON NUMBER	SOT-23 NUMBER		
IN	4	1	I	Input voltage supply. Connect a 1- $\mu$ F capacitor at this input.
OUT	1	5	O	Regulated output voltage. Connect a minimum 1- $\mu$ F low-ESR capacitor to this pin. Connect this output to the load circuit. An internal 230- $\Omega$ (typical) pulldown resistor prevents a charge remaining on $V_{OUT}$ when the regulator is in the shutdown mode ( $V_{EN}$ low).
EN	3	3	I	Enable input. A low voltage ( $< V_{IL}$ ) on this pin turns the regulator off and discharges the output pin to GND through an internal 230- $\Omega$ pulldown resistor. A high voltage ( $> V_{IH}$ ) on this pin enables the regulator output. This pin has an internal 1-M $\Omega$ pulldown resistor to hold the regulator off by default.
GND	2	2	—	Common ground
N/C	—	4	—	No internal electrical connection.
Thermal Pad	5	—	—	Thermal pad for X2SON package, connect to GND or leave floating. Do not connect to any potential other than GND.

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

		MIN	MAX	UNIT
V <sub>IN</sub>	Input voltage	-0.3	6	
V <sub>OUT</sub>	Output voltage	-0.3	See <sup>(3)</sup>	V
V <sub>EN</sub>	Enable input voltage	-0.3	6	
	Continuous power dissipation <sup>(4)</sup>	Internally Limited		W
T <sub>JMAX</sub>	Junction temperature			150 °C
T <sub>stg</sub>	Storage temperature	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to the GND pin.
- (3) Abs Max V<sub>OUT</sub> is the lesser of V<sub>IN</sub> + 0.3 V, or 6 V.
- (4) Internal thermal shutdown circuitry protects the device from permanent damage.

### 6.2 ESD Ratings

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±2000
		Charged-device model (CDM), per JEDEC specification JESD22-C101 <sup>(2)</sup>	±1000

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)</sup>

		MIN	MAX	UNIT
V <sub>IN</sub>	Input supply voltage	2.2	5.5	
V <sub>EN</sub>	Enable input voltage	0	5.5	V
I <sub>OUT</sub>	Output current	0	250	mA
T <sub>J</sub>	Junction temperature	-40	125	°C
T <sub>A</sub>	Ambient temperature <sup>(3)</sup>	-40	85	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to the GND pin.
- (3) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T<sub>A-MAX</sub>) is dependent on the maximum operating junction temperature (T<sub>J-MAX-OP</sub> = 125°C), the maximum power dissipation of the device in the application (P<sub>D-MAX</sub>), and the junction-to ambient thermal resistance of the part/package in the application (R<sub>θJA</sub>), as given by the following equation: T<sub>A-MAX</sub> = T<sub>J-MAX-OP</sub> - (R<sub>θJA</sub> × P<sub>D-MAX</sub>). See *Application and Implementation*.

## 6.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>		LP5907				UNIT
		DBV (SOT-23)	DQN (X2SON)	YKE (DSBGA)	YKM (DSBGA)	
		5 PINS	4 PINS	4 PINS	4 PINS	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	193.4	216.1	206.1	194.1	°C/W
R <sub>θJC(top)</sub>	Junction-to-case (top) thermal resistance	102.1	161.7	1.5	3.0	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	45.8	162.1	37.0	62.7	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	8.4	5.1	15.0	1.1	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	45.3	161.7	36.8	62.7	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case (bottom) thermal resistance	n/a	123.0	n/a	n/a	°C/W

(1) For more information about traditional and new thermal metrics, see the [Semiconductor and IC Package Thermal Metrics](#) application report.

## 6.5 Electrical Characteristics

$$V_{IN} = V_{OUT(NOM)} + 1 \text{ V}, V_{EN} = 1.2 \text{ V}, I_{OUT} = 1 \text{ mA}, C_{IN} = 1 \mu\text{F}, C_{OUT} = 1 \mu\text{F} \text{ (unless otherwise noted)}^{(1)(2)(3)}$$

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
V <sub>IN</sub>	Input voltage	T <sub>A</sub> = 25°C	2.2	5.5		V
$\Delta V_{OUT}$	Output voltage tolerance	V <sub>IN</sub> = (V <sub>OUT(NOM)</sub> + 1 V) to 5.5 V, I <sub>OUT</sub> = 1 mA to 250 mA	-2	2		%V <sub>OUT</sub>
		V <sub>IN</sub> = (V <sub>OUT(NOM)</sub> + 1 V) to 5.5 V, I <sub>OUT</sub> = 1 mA to 250 mA (V <sub>OUT</sub> < 1.8 V, SOT-23, X2SON packages)	-3	3		
	Line regulation	V <sub>IN</sub> = (V <sub>OUT(NOM)</sub> + 1 V) to 5.5 V, I <sub>OUT</sub> = 1 mA		0.02		%/V
	Load regulation	I <sub>OUT</sub> = 1 mA to 250 mA		0.001		%/mA
I <sub>LOAD</sub>	Load current	See <sup>(4)</sup>	0	250		mA
	Maximum output current		250			
I <sub>Q</sub>	Quiescent current <sup>(5)</sup>	V <sub>EN</sub> = 1.2 V, I <sub>OUT</sub> = 0 mA	12	25		μA
		V <sub>EN</sub> = 1.2 V, I <sub>OUT</sub> = 250 mA	250	425		
		V <sub>EN</sub> = 0.3 V (disabled)	0.2	1		
I <sub>G</sub>	Ground current <sup>(6)</sup>	V <sub>EN</sub> = 1.2 V, I <sub>OUT</sub> = 0 mA	14			μA
V <sub>DO</sub>	Dropout voltage <sup>(7)</sup>	I <sub>OUT</sub> = 100 mA	50			mV
		I <sub>OUT</sub> = 250 mA (DSBGA package)	120	200		
		I <sub>OUT</sub> = 250 mA (SOT-23, X2SON packages)		250		
I <sub>SC</sub>	Short-circuit current limit	T <sub>A</sub> = 25°C <sup>(8)</sup>	250	500		mA

- (1) All voltages are with respect to the device GND terminal, unless otherwise stated.
- (2) Minimum and maximum limits are ensured through test, design, or statistical correlation over the junction temperature (T<sub>J</sub>) range of -40°C to 125°C, unless otherwise stated. Typical values represent the most likely parametric norm at T<sub>A</sub> = 25°C, and are provided for reference purposes only.
- (3) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (T<sub>A-MAX</sub>) is dependent on the maximum operating junction temperature (T<sub>J-MAX-OP</sub> = 125°C), the maximum power dissipation of the device in the application (P<sub>D-MAX</sub>), and the junction-to-ambient thermal resistance of the part/package in the application R<sub>θJA</sub>, as given by the following equation: T<sub>A-MAX</sub> = T<sub>J-MAX-OP</sub> - (R<sub>θJA</sub> × P<sub>D-MAX</sub>). See [Application and Implementation](#).
- (4) The device maintains a stable, regulated output voltage without a load current.
- (5) Quiescent current is defined here as the difference in current between the input voltage source and the load at V<sub>OUT</sub>.
- (6) Ground current is defined here as the total current flowing to ground as a result of all input voltages applied to the device.
- (7) Dropout voltage is the voltage difference between the input and the output at which the output voltage drops to 100 mV below its nominal value.
- (8) Short-circuit current (I<sub>SC</sub>) for the LP5907 is equivalent to current limit. To minimize thermal effects during testing, I<sub>SC</sub> is measured with V<sub>OUT</sub> pulled to 100 mV below its nominal voltage.

## Electrical Characteristics (continued)

$V_{IN} = V_{OUT(NOM)} + 1 \text{ V}$ ,  $V_{EN} = 1.2 \text{ V}$ ,  $I_{OUT} = 1 \text{ mA}$ ,  $C_{IN} = 1 \mu\text{F}$ ,  $C_{OUT} = 1 \mu\text{F}$  (unless otherwise noted)<sup>(1)(2)(3)</sup>

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT		
PSRR	Power-supply rejection ratio <sup>(9)</sup>	$f = 100 \text{ Hz}$ , $I_{OUT} = 20 \text{ mA}$		90		dB	dB		
		$f = 1 \text{ kHz}$ , $I_{OUT} = 20 \text{ mA}$		82					
		$f = 10 \text{ kHz}$ , $I_{OUT} = 20 \text{ mA}$		65					
		$f = 100 \text{ kHz}$ , $I_{OUT} = 20 \text{ mA}$		60					
$e_N$	Output noise voltage <sup>(9)</sup>	BW = 10 Hz to 100 kHz	$I_{OUT} = 1 \text{ mA}$	10		µV <sub>RMS</sub>	µV <sub>RMS</sub>		
			$I_{OUT} = 250 \text{ mA}$	6.5					
$R_{AD}$	Output automatic discharge pulldown resistance	$V_{EN} < V_{IL}$ (output disabled)		230		Ω			
$T_{SD}$	Thermal shutdown	$T_J$ rising		160		°C	°C		
	Thermal hysteresis	$T_J$ falling from shutdown		15					
<b>LOGIC INPUT THRESHOLDS</b>									
$V_{IL}$	Low input threshold	$V_{IN} = 2.2 \text{ V to } 5.5 \text{ V}$ , $V_{EN}$ falling until the output is disabled		0.4		V			
$V_{IH}$	High input threshold	$V_{IN} = 2.2 \text{ V to } 5.5 \text{ V}$ $V_{EN}$ rising until the output is enabled		1.2		V			
$I_{EN}$	Input current at EN pin <sup>(10)</sup>	$V_{EN} = 5.5 \text{ V}$ and $V_{IN} = 5.5 \text{ V}$		5.5		µA	µA		
		$V_{EN} = 0 \text{ V}$ and $V_{IN} = 5.5 \text{ V}$		0.001					
<b>TRANSIENT CHARACTERISTICS</b>									
$\Delta V_{OUT}$	Line transient <sup>(9)</sup>	$V_{IN} = (V_{OUT(NOM)} + 1 \text{ V})$ to $(V_{OUT(NOM)} + 1.6 \text{ V})$ in 30 µs		-1		mV	mV		
		$V_{IN} = (V_{OUT(NOM)} + 1.6 \text{ V})$ to $(V_{OUT(NOM)} + 1.6 \text{ V})$ in 30 µs		1					
	Load transient <sup>(9)</sup>	$I_{OUT} = 1 \text{ mA to } 250 \text{ mA}$ in 10 µs		-40					
		$I_{OUT} = 250 \text{ mA to } 1 \text{ mA}$ in 10 µs		40					
	Overshoot on start-up <sup>(9)</sup>	Stated as a percentage of $V_{OUT(NOM)}$		5%					
Overshoot on start-up with EN <sup>(9)</sup>		Stated as a percentage of $V_{OUT(NOM)}$ , $V_{IN} = V_{OUT} + 1 \text{ V to } 5.5 \text{ V}$ , $0.7 \mu\text{F} < C_{OUT} < 10 \mu\text{F}$ , $0 \text{ mA} < I_{OUT} < 250 \text{ mA}$ , EN rising until the output is enabled		1%					
$t_{ON}$	Turnon time	From $V_{EN} > V_{IH}$ to $V_{OUT} = 95\%$ of $V_{OUT(NOM)}$ , $T_A = 25^\circ\text{C}$		80	150	µs			

(9) This specification is verified by design.

(10) There is a 1-MΩ resistor between EN and ground on the device.

## 6.6 Output and Input Capacitors

over operating free-air temperature range (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN <sup>(1)</sup>	TYP	MAX	UNIT
$C_{IN}$	Input capacitance <sup>(2)</sup>	Capacitance for stability	0.7	1		µF
$C_{OUT}$	Output capacitance <sup>(2)</sup>		0.7	1	10	µF
ESR			5		500	mΩ

(1) The minimum capacitance should be greater than 0.5 µF over the full range of operating conditions. The capacitor tolerance should be 30% or better over the full temperature range. The full range of operating conditions for the capacitor in the application must be considered during device selection to ensure this minimum capacitance specification is met. X7R capacitors are recommended however capacitor types X5R, Y5V and Z5U may be used with consideration of the application and conditions.

(2) This specification is verified by design.

## 6.7 Typical Characteristics

$V_{IN} = 3.7\text{ V}$ ,  $V_{OUT} = 2.8\text{ V}$ ,  $I_{OUT} = 1\text{ mA}$ ,  $C_{IN} = 1\text{ }\mu\text{F}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

Figure 6. Load Regulation

## Typical Characteristics (continued)

$V_{IN} = 3.7\text{ V}$ ,  $V_{OUT} = 2.8\text{ V}$ ,  $I_{OUT} = 1\text{ mA}$ ,  $C_{IN} = 1\text{ }\mu\text{F}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

## Typical Characteristics (continued)

$V_{IN} = 3.7\text{ V}$ ,  $V_{OUT} = 2.8\text{ V}$ ,  $I_{OUT} = 1\text{ mA}$ ,  $C_{IN} = 1\text{ }\mu\text{F}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

## Typical Characteristics (continued)

$V_{IN} = 3.7\text{ V}$ ,  $V_{OUT} = 2.8\text{ V}$ ,  $I_{OUT} = 1\text{ mA}$ ,  $C_{IN} = 1\text{ }\mu\text{F}$ ,  $C_{OUT} = 1\text{ }\mu\text{F}$ ,  $T_A = 25^\circ\text{C}$  (unless otherwise noted)

## 7 Detailed Description

### 7.1 Overview

Designed to meet the needs of sensitive RF and analog circuits, the LP5907 provides low noise, high PSRR, low quiescent current, as well as low line and load transient response figures. Using new innovative design techniques, the LP5907 offers class leading noise performance without the need for a separate noise filter capacitor.

The LP5907 is designed to perform with a single 1- $\mu$ F input capacitor and a single 1- $\mu$ F ceramic output capacitor. With a reasonable PCB layout, the single 1- $\mu$ F ceramic output capacitor can be placed up to 10 cm away from the LP5907 device.

### 7.2 Functional Block Diagram

### 7.3 Feature Description

#### 7.3.1 Enable (EN)

The LP5907 EN pin is internally held low by a 1-MΩ resistor to GND. The EN pin voltage must be higher than the  $V_{IH}$  threshold to ensure that the device is fully enabled under all operating conditions. The EN pin voltage must be lower than the  $V_{IL}$  threshold to ensure that the device is fully disabled and the automatic output discharge is activated.

#### 7.3.2 Low Output Noise

Any internal noise at the LP5907 reference voltage is reduced by a first order low-pass RC filter before it is passed to the output buffer stage. The low-pass RC filter has a -3 dB cut-off frequency of approximately 0.1 Hz.

## Feature Description (continued)

### 7.3.3 Output Automatic Discharge

The LP5907 output employs an internal 230- $\Omega$  (typical) pulldown resistance to discharge the output when the EN pin is low, and the device is disabled.

### 7.3.4 Remote Output Capacitor Placement

The LP5907 requires at least a 1- $\mu\text{F}$  capacitor at the OUT pin, but there are no strict requirements about the location of the capacitor in regards the OUT pin. In practical designs, the output capacitor may be located up to 10 cm away from the LDO.

### 7.3.5 Thermal Overload Protection ( $T_{SD}$ )

Thermal shutdown disables the output when the junction temperature rises to approximately 160°C which allows the device to cool. When the junction temperature cools to approximately 145°C, the output circuitry enables. Based on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This thermal cycling limits the dissipation of the regulator and protects it from damage as a result of overheating.

The thermal shutdown circuitry of the LP5907 has been designed to protect against temporary thermal overload conditions. The  $T_{SD}$  circuitry was not intended to replace proper heat-sinking. Continuously running the LP5907 device into thermal shutdown may degrade device reliability.

## 7.4 Device Functional Modes

### 7.4.1 Enable (EN)

The LP5907 Enable (EN) pin is internally held low by a 1-M $\Omega$  resistor to GND. The EN pin voltage must be higher than the  $V_{IH}$  threshold to ensure that the device is fully enabled under all operating conditions.

When the EN pin is pulled low, and the output is disabled, the output automatic discharge circuitry is activated. Any charge on the OUT pin is discharged to GND through the internal 230- $\Omega$  (typical) pulldown resistance.

### 7.4.2 Minimum Operating Input Voltage ( $V_{IN}$ )

The LP5907 does not include any dedicated UVLO circuitry. The LP5907 internal circuitry is not fully functional until  $V_{IN}$  is at least 2.2 V. The output voltage is not regulated until  $V_{IN}$  has reached at least the greater of 2.2 V or  $(V_{OUT} + V_{DO})$ .

## 8 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

The LP5907 is designed to meet the requirements of RF and analog circuits, by providing low noise, high PSRR, low quiescent current, and low line or load transient response figures. The device offers excellent noise performance without the need for a noise bypass capacitor and is stable with input and output capacitors with a value of 1  $\mu$ F. The LP5907 delivers this performance in industry standard packages such as DSBGA, X2SON, and SOT-23 which, for this device, are specified with an operating junction temperature ( $T_J$ ) of  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$ .

### 8.2 Typical Application

Figure 21 shows the typical application circuit for the LP5907. Input and output capacitances may need to be increased above the 1  $\mu$ F minimum for some applications.

**Figure 21. LP5907 Typical Application**

#### 8.2.1 Design Requirements

DESIGN PARAMETER	EXAMPLE VALUE
Input voltage range	2.2 V to 5.5 V
Output voltage	1.8 V
Output current	200 mA
Output capacitor range	0.7 $\mu$ F to 10 $\mu$ F
Input/Output capacitor ESR range	5 to 500 m $\Omega$

## 8.2.2 Detailed Design Procedure

### 8.2.2.1 Custom Design With WEBENCH® Tools

[Click here](#) to create a custom design using the LP5907 device with the WEBENCH® Power Designer.

1. Start by entering the input voltage ( $V_{IN}$ ), output voltage ( $V_{OUT}$ ), and output current ( $I_{OUT}$ ) requirements.
2. Optimize the design for key parameters such as efficiency, footprint, and cost using the optimizer dial.
3. Compare the generated design with other possible solutions from Texas Instruments.

The WEBENCH Power Designer provides a customized schematic along with a list of materials with real-time pricing and component availability.

In most cases, these actions are available:

- Run electrical simulations to see important waveforms and circuit performance
- Run thermal simulations to understand board thermal performance
- Export customized schematic and layout into popular CAD formats
- Print PDF reports for the design, and share the design with colleagues

Get more information about WEBENCH tools at [www.ti.com/WEBENCH](http://www.ti.com/WEBENCH).

### 8.2.2.2 Power Dissipation and Device Operation

The permissible power dissipation for any package is a measure of the capability of the device to pass heat from the power source, the junctions of the IC, to the ultimate heat sink, the ambient environment. Thus, the power dissipation is dependent on the ambient temperature and the thermal resistance across the various interfaces between the die junction and ambient air.

The maximum allowable power dissipation for the device in a given package can be calculated using [Equation 1](#):

$$P_{D-MAX} = ((T_{J-MAX} - T_A) / R_{\theta JA}) \quad (1)$$

The actual power being dissipated in the device can be represented by [Equation 2](#):

$$P_D = (V_{IN} - V_{OUT}) \times I_{OUT} \quad (2)$$

These two equations establish the relationship between the maximum power dissipation allowed due to thermal consideration, the voltage drop across the device, and the continuous current capability of the device. These two equations should be used to determine the optimum operating conditions for the device in the application.

In applications where lower power dissipation ( $P_D$ ) and/or excellent package thermal resistance ( $R_{\theta JA}$ ) is present, the maximum ambient temperature ( $T_{A-MAX}$ ) may be increased.

In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature ( $T_{A-MAX}$ ) may have to be derated.  $T_{A-MAX}$  is dependent on the maximum operating junction temperature ( $T_{J-MAX-OP} = 125^\circ C$ ), the maximum allowable power dissipation in the device package in the application ( $P_{D-MAX}$ ), and the junction-to ambient thermal resistance of the part/package in the application ( $R_{\theta JA}$ ), as given by [Equation 3](#):

$$T_{A-MAX} = (T_{J-MAX-OP} - (R_{\theta JA} \times P_{D-MAX})) \quad (3)$$

Alternately, if  $T_{A-MAX}$  can not be derated, the  $P_D$  value must be reduced. This can be accomplished by reducing  $V_{IN}$  in the  $V_{IN}-V_{OUT}$  term as long as the minimum  $V_{IN}$  is met, or by reducing the  $I_{OUT}$  term, or by some combination of the two.

### 8.2.2.3 External Capacitors

Like most low-dropout regulators, the LP5907 requires external capacitors for regulator stability. The device is specifically designed for portable applications requiring minimum board space and smallest components. These capacitors must be correctly selected for good performance.

### 8.2.2.4 Input Capacitor

An input capacitor is required for stability. The input capacitor should be at least equal to, or greater than, the output capacitor for good load transient performance. At least a 1  $\mu F$  capacitor has to be connected between the LP5907 input pin and ground for stable operation over full load current range. Basically, it is ok to have more output capacitance than input, as long as the input is at least 1  $\mu F$ .

The input capacitor must be located a distance of not more than 1 cm from the input pin and returned to a clean analog ground. Any good quality ceramic, tantalum, or film capacitor may be used at the input.

---

#### NOTE

To ensure stable operation it is essential that good PCB practices are employed to minimize ground impedance and keep input inductance low. If these conditions cannot be met, or if long leads are to be used to connect the battery or other power source to the LP5907, TI recommends increasing the input capacitor to at least 10  $\mu\text{F}$ . Also, tantalum capacitors can suffer catastrophic failures due to surge current when connected to a low-impedance source of power (like a battery or a very large capacitor). If a tantalum capacitor is used at the input, it should be verified by the manufacturer to have a surge current rating sufficient for the application. The initial tolerance, applied voltage de-rating, and temperature coefficient must all be considered when selecting the input capacitor to ensure the actual capacitance is never less than 0.7  $\mu\text{F}$  over the entire operating range.

---

#### 8.2.2.5 Output Capacitor

The LP5907 is designed specifically to work with a very small ceramic output capacitor, typically 1  $\mu\text{F}$ . A ceramic capacitor (dielectric types X5R or X7R) in the 1  $\mu\text{F}$  to 10  $\mu\text{F}$  range, and with ESR between 5 m $\Omega$  to 500 m $\Omega$ , is suitable in the LP5907 application circuit. For this device the output capacitor should be connected between the OUT pin and a good connection back to the GND pin.

It may also be possible to use tantalum or film capacitors at the device output,  $V_{\text{OUT}}$ , but these are not as attractive for reasons of size and cost (see [Capacitor Characteristics](#)).

The output capacitor must meet the requirement for the minimum value of capacitance and have an ESR value that is within the range 5 m $\Omega$  to 500 m $\Omega$  for stability. Like the input capacitor, the initial tolerance, applied voltage de-rating, and temperature coefficient must all be considered when selecting the input capacitor to ensure the actual capacitance is never less than 0.7  $\mu\text{F}$  over the entire operating range.

#### 8.2.2.6 Capacitor Characteristics

The LP5907 is designed to work with ceramic capacitors on the input and output to take advantage of the benefits they offer. For capacitance values in the range of 1  $\mu\text{F}$  to 10  $\mu\text{F}$ , ceramic capacitors are the smallest, least expensive and have the lowest ESR values, thus making them best for eliminating high frequency noise. The ESR of a typical 1  $\mu\text{F}$  ceramic capacitor is in the range of 20 m $\Omega$  to 40 m $\Omega$ , which easily meets the ESR requirement for stability for the LP5907.

A better choice for temperature coefficient in a ceramic capacitor is X7R. This type of capacitor is the most stable and holds the capacitance within  $\pm 15\%$  over the temperature range. Tantalum capacitors are less desirable than ceramic for use as output capacitors because they are more expensive when comparing equivalent capacitance and voltage ratings in the 1  $\mu\text{F}$  to 10  $\mu\text{F}$  range.

Another important consideration is that tantalum capacitors have higher ESR values than equivalent size ceramics. This means that while it may be possible to find a tantalum capacitor with an ESR value within the stable range, it would have to be larger in capacitance (which means bigger and more costly) than a ceramic capacitor with the same ESR value. It should also be noted that the ESR of a typical tantalum increases about 2:1 as the temperature goes from 25°C down to -40°C, so some guard band must be allowed.

#### 8.2.2.7 Remote Capacitor Operation

The LP5907 requires at least a 1- $\mu\text{F}$  capacitor at the OUT pin, but there is no strict requirements about the location of the capacitor in regards to the pin. In practical designs the output capacitor may be located up to 10 cm away from the LDO. This means that there is no need to have a special capacitor close to the output pin if there is already respective capacitors in the system (like a capacitor at the input of supplied part). The remote capacitor feature helps user to minimize the number of capacitors in the system.

---

As a good design practice, keep the wiring parasitic inductance at a minimum, which means to use as wide as possible traces from the LDO output to the capacitors, keeping the LDO output trace layer as close to ground layer as possible and avoiding vias on the path. If there is a need to use vias, implement as many as possible vias between the connection layers. The recommendation is to keep parasitic wiring inductance less than 35 nH. For the applications with fast load transients, it is recommended to use an input capacitor equal to or larger than the sum of the capacitance at the output node for the best load transient performance.

#### 8.2.2.8 No-Load Stability

The LP5907 remains stable, and in regulation, with no external load.

#### 8.2.2.9 Enable Control

The LP5907 may be switched ON or OFF by a logic input at the EN pin. A voltage on this pin greater than  $V_{IH}$  turns the device on, while a voltage less than  $V_{IL}$  turns the device off.

When the EN pin is low, the regulator output is off and the device typically consumes less than 1  $\mu$ A. Additionally, an output pulldown circuit is activated which ensures that any charge stored on  $C_{OUT}$  is discharged to ground.

If the application does not require the use of the shutdown feature, the EN pin can be tied directly to the IN pin to keep the regulator output permanently on.

An internal 1-M $\Omega$  pulldown resistor ties the EN input to ground, ensuring that the device remains off if the EN pin is left open circuit. To ensure proper operation, the signal source used to drive the EN pin must be able to swing above and below the specified turnon or turnoff voltage thresholds listed in the *Electrical Characteristics* under  $V_{IL}$  and  $V_{IH}$ .

### 8.2.3 Application Curves

## 9 Power Supply Recommendations

This device is designed to operate from an input supply voltage range of 2.2 V to 5.5 V. The input supply must be well regulated and free of spurious noise. To ensure that the LP5907 output voltage is well regulated and dynamic performance is optimum, the input supply must be at least  $V_{OUT} + 1$  V. A minimum capacitor value of 1  $\mu$ F is required to be within 1 cm of the IN pin.

## 10 Layout

### 10.1 Layout Guidelines

The dynamic performance of the LP5907 is dependant on the layout of the PCB. PCB layout practices that are adequate for typical LDOs may degrade the PSRR, noise, or transient performance of the LP5907.

Best performance is achieved by placing  $C_{IN}$  and  $C_{OUT}$  on the same side of the PCB as the LP5907, and as close to the package as is practical. The ground connections for  $C_{IN}$  and  $C_{OUT}$  must be back to the LP5907 ground pin using as wide and short a copper trace as is practical.

Connections using long trace lengths, narrow trace widths, and/or connections through vias must be avoided. These add parasitic inductances and resistance that results in inferior performance especially during transient conditions.

#### 10.1.1 X2SON Mounting

The X2SON package thermal pad must be soldered to the printed circuit board for proper thermal and mechanical performance. For more information, see the [QFN/SON PCB Attachment](#) application report.

#### 10.1.2 DSBGA Mounting

The DSBGA package requires specific mounting techniques, which are detailed in [AN-1112 DSBGA Wafer Level Chip Scale Package](#). For best results during assembly, alignment ordinals on the PC board may be used to facilitate placement of the DSBGA device.

#### 10.1.3 DSBGA Light Sensitivity

Exposing the DSBGA device to direct light may cause incorrect operation of the device. Light sources such as halogen lamps can affect electrical performance if they are situated in proximity to the device. Light with wavelengths in the red and infrared part of the spectrum have the most detrimental effect; thus, the fluorescent lighting used inside most buildings has very little effect on performance.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. ## PACKAGE OUTLINE

**DBV0005A**

## **SOT-23 - 1.45 mm max height**

## SMALL OUTLINE TRANSISTOR

4214839/F 06/2021

## NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
  2. This drawing is subject to change without notice.
  3. Reference JEDEC MO-178.
  4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.25 mm per side.

# EXAMPLE BOARD LAYOUT

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

LAND PATTERN EXAMPLE  
EXPOSED METAL SHOWN  
SCALE:15X

SOLDER MASK DETAILS

4214839/F 06/2021

NOTES: (continued)

5. Publication IPC-7351 may have alternate designs.

6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

# EXAMPLE STENCIL DESIGN

DBV0005A

SOT-23 - 1.45 mm max height

SMALL OUTLINE TRANSISTOR

SOLDER PASTE EXAMPLE  
BASED ON 0.125 mm THICK STENCIL  
SCALE:15X

4214839/F 06/2021

NOTES: (continued)

7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

# PACKAGE OUTLINE

**YKG0004**

## **DSBGA - 0.33mm MAX HEIGHT**

## DIE SIZE BALL GRID ARRAY

4218366/E 05/2020

## NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
  2. This drawing is subject to change without notice.

# PACKAGE OUTLINE

## X2SON - 0.4 mm max height

PLASTIC SMALL OUTLINE - NO LEAD

DQN0004A

4215302/E 12/2016

### NOTES:

- All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
- This drawing is subject to change without notice.
- The package thermal pad must be soldered to the printed circuit board for optimal thermal and mechanical performance.
- Features may not exist. Recommend use of pin 1 marking on top of package for orientation purposes.
- Shape of exposed side leads may differ.
- Number and location of exposed tie bars may vary.

# EXAMPLE BOARD LAYOUT

NOTES: (continued)

7. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slua271](http://www.ti.com/lit/slua271)).
8. If any vias are implemented, it is recommended that vias under paste be filled, plugged or tented.
