

## High Efficiency 3MHz, 4A Synchronous Step Down Regulator

### General Description

The SY8856 is a high efficiency 3MHz synchronous step down DC/DC regulator capable of delivering up to 4A output current. It operates over a wide input voltage range from 2.7V to 5.5V. It integrates main switch and synchronous switch with very low  $R_{DS(ON)}$  to minimize the conduction loss. High integrated solution and DFN2 $\times$ 2-8 package perform the optimized BOM cost and reduce external component count. Low input and output voltage ripple, small external inductor and capacitor sizes, small PCB layout space are achieved.

Pin Name	Pin Number	Description
EN	1	Enable control. Pulled high to turn on. Do not leave it floating.
IN	2	Power input pin.
LX	3,6	Inductor pin. Connect this pin to the switching node of the inductor.
GND	4,5	Ground pin.
PG	7	Power good indicator, open drain. When the output voltage exceeds 90% of regulation point, it becomes high, low otherwise.
FB	8	Output feedback pin. Connect this pin to the center point of the output resistor divider(as shown in Figure1) to program the output voltage: $V_{OUT}=0.6 \times (1+R_H/R_L)$

**Note 1:** Stresses beyond the “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**Note 2:**  $\theta_{JA}$  is measured in the natural convection at  $T_A = 25^\circ C$  on 2OZ four-layer Silergy evaluation board of JEDEC 51-3 thermal measurement standard. Paddle of DFN2 $\times$ 2-8 package is the case position for  $\theta_{JC}$  measurement.

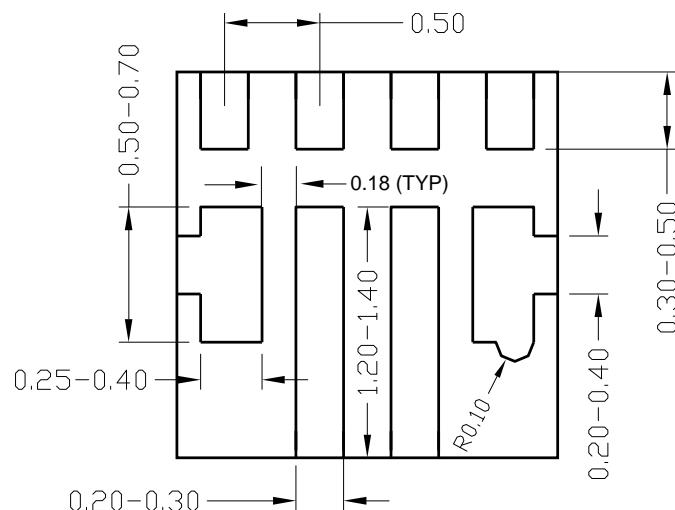

**Note 3:** The device is not guaranteed to function outside its operating conditions.
